Course title (and course title in English)	工学倫理 Engineering Ethics		Instructor's name, job title, and department of affiliation	Graduate School of Informatics Professor, NIITSU KIICHI Graduate School of Engineering Professor, ISHIDA TAIICHIROU Graduate School of Engineering Professor, IMAHORI HIROSHI Graduate School of Engineering Professor, SUZUKI MOTOFUMI Part-time Lecturer, TATEBA TAKAFUMI Graduate School of Informatics Professor, UMENO KEN Graduate School of Engineering Professor, SUGIYASU KAZUNORI Graduate School of Engineering Professor, HANAZAKI HIDESHI Graduate School of Engineering Professor, KAWASE MOTOAKI Office of Institutional Advancement and Communications NAKAGAWA MASAYUKI Graduate School of Engineering Professor, KISHIDA KIYOUSUKE Graduate School of Engineering Professor, OONISHI MASAMITSU Graduate School of Engineering Professor, KANETA TAKASHI Graduate School of Engineering Professor, ITOH SADAHIKO Graduate School of Engineering Senior Lecturer, HAYASHI KAZUKI	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Thu.3	Class style	Lecture (Media-based course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Modern ethics based on engineering aspect are becoming essential to present engineers and scientists. Instructors from various faculties give lectures about ethics in their research fields.					
[Course objectives]					
The goal of this class is to understand engineering ethics, and to develop the ability to judge by yourself when you encounter ethical issues.					
[Course schedule and contents]					
Lectures on ethics in various fields of engineering will be given by faculty members of the Graduate School of Engineering or other graduate schools. (Details will be provided after they are determined.) This course is a media course in which all lectures will be given online via Zoom.

Course title (and course title in English)	工学序論 Introduction to Engineering		Instructor's name, job title, and department of affiliation	Graduate School of Management Professor,YAMAMOTO TAKASHI Graduate School of Engineering Professor,ARAKI YOSHIKAZU Graduate School of Engineering Professor,HANAZAKI HIDESHI Graduate School of Informatics Professor,NOMURA TAISHIN Graduate School of Engineering Professor,OGOSHI TOMOKI Graduate School of Informatics Professor,Takayuki ITO Office of Institutional Advancement and Communications Program-Specific Professor,KITANI TETSUO Graduate School of Engineering Senior Lecturer,ISHITSUKA KAZUYA	
Target year	1st year students or above	Number of credits	1	Year/semesters	2025/Intensive, First semester
Days and periods	Intensive	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
<p>Engineering is to inquire after truth, to develop useful technologies, and to establish ways how to give back development results of technology to the society.</p> <p>First, we offer special lectures regarding the basic knowledge that students in faculty of engineering are expected to have.</p> <p>Then, we offer a series of intensive lectures about how engineering can suggest solutions of current and future problems of our society, the value of technology, and the responsibilities that researchers and engineers are expected to fulfill.</p>					
[Course objectives]					
Students learn basic matters such as attitudes and responsibilities they are expected to take as a member of social community. They find value in studying engineering and become to consider what they do in future by understanding technology can suggest solutions of problems our society is facing, especially problems about safety and security.					
[Course schedule and contents]					
<p>Special lectures,1time, About basic knowledge and attitude as students who start to learn engineering, and the role of engineering in society.</p> <p>Intensive lectures,6times, A series of lectures offered by special lecturers playing on global stages of science and technology. Lectures are for understanding the role that technology is playing in modern society, for reconfirming importance to study engineering and to work as a researcher and engineer in society, and are to be opportunities to consider own future path. Essays are assigned in every lecture to summarize the lecture content and opinions of other students.</p> <p>Schedule of the lectures are announced later.</p>

Course number		U-ENG20 32402 SE77							
Course title (and course title in English)		工学部国際インターンシップ 1 Faculty of Engineering International Internship 1			Instructor's name, job title, and department of affiliation		Graduate School of Engineering Professor, HONDA MITSURU Graduate School of Engineering Senior Lecturer, KOWHAKUL, Wasana		
Target year		3rd year students or above		Number of credits		1	Year/semesters	2025/Intensive, year-round	
Days and periods		Intensive		Class style		Seminar (Face-to-face course)		Language of instruction	Japanese and English
[Overview and purpose of the course]									
<p>The internships and related training programs (lasting less than three months) offered through the Faculty of Engineering at Kyoto University, whether conducted overseas or domestically but expected to have a similar educational effect as internships abroad, are targeted. The aim is to cultivate independence, proactivity, internationality, and language skills by placing students in diverse environments, thereby contributing to their career development after graduation.</p>									
[Course objectives]									
<p>The purpose is to enhance the expansion of international perspectives, the acquisition of international sensibilities, the improvement of foreign language proficiency (communication skills), and the enhancement of cultural receptiveness (cross-cultural adaptability) by experiencing internships in diverse environments such as overseas universities and companies.</p>									
[Course schedule and contents]									
<p>[Submission of the internship plan (1 time)] Complete and submit the form ‘ International Internship Plan ’ at least one month before the internship takes place and undergo a preliminary review.</p> <p>[Overseas internship (1 time)] Participate in an internship abroad.</p> <p>[Results debriefing (1 time)] Internship participants report on the results of their internship and discuss their findings.</p>									
[Course requirements]									
<p>Have sufficient language skills in the language(s) spoken at the internship site. * Must have purchased the prescribed overseas travel insurance before traveling to the internship site. * Have submitted an overseas travel registration form in advance.</p>									
[Evaluation methods and policy]									
<p>After registering for the course, one month prior to participating in the internship, students must fill out the “ International Internship Plan ” on the designated form and submit it to the Undergraduate Student Section of Educational Affairs Division for prior review by the faculty members of the ER center. After completion of the internship, students will be awarded credits (100%) based on the submission of an</p>									
<div style="text-align: right;">Continue to 工学部国際インターンシップ 1 (2)</div>									

工学部国際インターンシップ 1 (2)

internship report and the content of the presentation at the debriefing session.

It is also advisable to submit a certificate of completion from the institution hosting the internship.

The decision to grant credits for graduation will be made by each undergraduate school. If the credits are not approved as credits required for graduation, the ER center will make the decision. In this case, the credits will be treated as excess credits.

Whether the internship is approved as credit for “ 1 ” (1 credit) or “ 2 ” (2 credits) of the International Internship Program of the Faculty of Engineering is determined based on the duration of the internship and the content of the practical training during the internship period, but in the case of “ 2, ” overseas travel is required.

[Courses delivered by instructors with practical work experience]

(1) Category

A course that includes off-campus training classes.

(2) Details of instructors ' practical work experience related to the course

(3) Details of practical classes delivered based on instructors ' practical work experience

Course number	U-ENG20 22403 SJ77				
Course title (and course title in English)	グローバル・リーダーシップセミナーⅠ(企業調査研究) Global Leadership Seminar I (Study for methodology in a company)		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Senior Lecturer, hirai yoshikazu	
Target year	2nd year students or above	Number of credits	1	Year/semesters	2025/Intensive, year-round
Days and periods	Intensive	Class style	Seminar (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
The purpose of this course is to study about how worldwide leading company, institute, etc. make proposals and find solutions for expanding their own technologies to the international market. Throughout hands-on training on their laboratory, students investigate the methodology of team organization, proposal, market prediction and conception ability by group works. After the investigation, students are expected to improve their comprehension and explanation capability. As extended exercise subject of this course, the Global Leadership Seminar II is opened in the second semester.					
[Course objectives]					
The goal of this course is to improve student's comprehension and explanation capability for processes of proposal and expansion on the international market investigating worldwide leading companies by group work.					
[Course schedule and contents]					
Week 1, Guidance Week 2-13, Hands-on training Week 14, Pre-presentation Week 15, Final presentation					
[Course requirements]					
How to register will be announced later. Students who want to join this course is requested to attend the first class.					
[Evaluation methods and policy]					
Students are prohibited to skip hands-on training. Evaluation will be based on presentation.

Course number		U-ENG20 22503 SJ77			
Course title (and course title in English)	グローバル・リーダーシップセミナーⅡ(イノベーションとその事業化) Global Leadership Seminar II (Innovation and its commercialization)		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor, HONDA MITSURU Graduate School of Engineering Senior Lecturer, hirai yoshikazu	
Target year	2nd year students or above	Number of credits	1	Year/semesters	2025/Intensive, Second semester
Days and periods	Intensive	Class style	Seminar (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
<p>The capabilities that society expects from Kyoto University students primarily include "deep knowledge in their respective fields of specialization" and the "ability to identify issues on their own and present a path to resolution." In this course, you will develop the latter capability, which is difficult to acquire through regular lectures and university life, by creating new business plans through group work. While individual activities are allowed, group activities are encouraged.</p> <p>[Features of this Course]</p> <ol style="list-style-type: none"> 1. Distinguished Instructors: Under the mentoring of renowned innovators active in the business world, students will engage in setting challenges and planning solutions. 2. Activity Budget: A budget will be provided for market research, prototype production, and software development necessary for developing project proposals. 3. Presentation Opportunities: Outstanding proposals may be displayed at the Katsura Library, among other opportunities for commercialization. <p>[Mentors]</p> <ul style="list-style-type: none"> - Mitsuaki Oshima, Special Appointment Professor (Honorary Technical Supervisor at Panasonic HD, Director of ESL Research Institute): A leading Japanese innovator, known for inventions like image stabilization for cameras and 5G communication technologies. Recipient of the Purple Ribbon Medal and the Order of the Rising Sun, Gold Rays with Rosette. https://hillslife.jp/learning/2018/05/06/new-perspective6/ - Seiichi Nishimoto, Honorary Professor (Chairman of the Kyoto Advanced Technology Research Institute): Supports the development of science and technology in the Kyoto area and the growth of ventures and SMEs. https://www.astem.or.jp/about/researcher/nishimoto - Kentaro Kaneko, Professor (Ritsumeikan University, Research Organization of Science and Technology; Director of Ritsumeikan Semiconductor Application research center): Co-founder of FLOSFIA and Patentix, continuously innovating new semiconductor materials. https://kaneko-lab.ritsumeai.ac.jp/ https://www.ritsumeai.ac.jp/research/center/risa/ - Teppei Tsushima, Open Innovation Dept., IP Div., Sony Corporation: Founder of Sony's smartwatch business, wena. https://www.sony.com/ja/SonyInfo/DiscoverSony/articles/202203/wena/ - Hideki Aoyama, Special Appointment Lecturer, Panasonic HD: Developer of the visible light communication technology LinkRay(TM) and vice-chairman for the international standardization of the IEEE802.15.7 communication standard. https://hidekia.github.io/ 					
Continue to グローバル・リーダーシップセミナーⅡ(イノベーションとその事業化)(2)					

- Tsutomu Mukai, Senior Manager, Panasonic HD: Promotes open innovation with venture companies in Israel.

Professor Mitsuaki Oshima is one of Japan's "Top 10 Representative Inventors," known for inventing and developing fundamental patents in technologies such as camera image stabilization in iPhones and high-speed and ultra-low latency communication for 5G mobile phones. Additionally, he invented multi-disciplinary technologies like anti-piracy measures for Nintendo Wii software, digital TV broadcasting standards in Japan, the US, and Europe, and IoT home appliances. He is famous as a serial innovator. Professor Oshima will introduce how groundbreaking inventions that change society originate.

In addition to the mentors, you can learn about the support system for startups and patent strategies from the invited lecturers. For those considering starting a startup, there is information that can be immediately utilized, and for others, there are valuable lessons that will be beneficial when entering society.

More information can be found on the following page (in Japanese):
<https://www.erc.t.kyoto-u.ac.jp/ugrad>

[Notes]

This seminar is intended for students in their second year of the Engineering Department or higher. The seminar is worth one credit, but whether it is recognized as a required credit for graduation depends on the undergraduate school. Please confirm with your undergraduate school office. Also, a camp is planned for December 6th and 7th, so it is necessary to be enrolled in the Personal Accident Insurance for Students Pursuing Education and Research(" Gakkensai "). Participation in the camp is recommended.

[Course objectives]

Through group work, you can acquire the ability to plan and propose solutions, starting from identifying and setting challenges to envisioning the creation of social value.

[Course schedule and contents]

The course will be conducted in person.

- [Orientation] (1 session): The overview and schedule of the course will be explained.
- [Lectures] (4 sessions): Special lectures by experts will be conducted.
- [Team Building] (1 session): An exercise in team building, essential for group work, will be carried out.
- [Group Work] (7 sessions): Students will engage in setting challenges, problem identification, data collection, and group work. Through intensive group work discussions, they will plan and propose solutions to the identified issues, create a draft report, and conduct 2-3 presentations. Holding mini-lectures by special instructors will also be planned.
- [Camp] (1 session): An intensive session dedicated to project work in an environment exclusive to participants and mentors through overnight training camp.
- [Preliminary Review Session] (1 session): A class to practice presentations in preparation for the final presentation event.
- [Final Presentation Event] (1 session): The final presentations will take place, followed by submission of presentation materials.

[Course requirements]

If the number of students enrolling in the course is large, the maximum number of students may be determined.

[Evaluation methods and policy]

[Evaluation Method]

Grades will be based on regular participation (20%) and the presentation and submission of presentation materials at the final presentation event held during the last lecture session (80%). Regular participation evaluation will focus on the student's active participation in the lectures.

[Evaluation Policy]

We will comprehensively evaluate the ability to identify and set challenges through group discussions, as well as the ability to propose solutions towards achieving goals. Students are required to develop individual or group business plans through the challenges and group work, and to present them at the final presentation event.

Attendance in lectures per se is not a criterion for grade evaluation; however, as the course involves group work, regular attendance is strongly recommended.

[Textbooks]

We will let you know if necessary.

[References, etc.]

(Reference books)

III. Oreilly, Charles A. 『Lead and Disrupt: How to Solve the Innovator's Dilemma』 (Stanford Business Books, 2021) ISBN:978-1503629523

We will let you know if necessary.

[Study outside of class (preparation and review)]

Please prepare and develop your own ideas in advance that you would like to work on throughout the course.

(Other information (office hours, etc.))

[Schedule for the 2024 Academic Year]

The classes will be conducted in person on Fridays during the 5th period in Lecture Room W3, Research Building 9.

*Note: The 3rd lecture will be held in Lecture Room W301, Research Building 9 (subject to change in lecture room).

- Orientation: October 3

- Fundamentals of Group Work: October 17

- Special Lectures, In-Person Group Work: October 10, 24, 31; November 7, 14, 28; December 5, 12, 19, 26; January 9

- Camp: December 6 (Sat) 13:00 - December 7 (Sun) 13:00 @ AWL Keihoku (tentative)

- Preliminary Review Session: January 16

- Final Presentation: January 17 (Sat)

*Please note that whether the credits earned are recognized as necessary for graduation depends on your undergraduate school. Refer to your undergraduate school course guide for more information.

*Registration for the course is not through KULASIS but via the following page. It is scheduled to open around September 2025:

https://www.t.kyoto-u.ac.jp/fs/erc/2025Fall_GL_seminar2

For details on office hours, please check KULASIS.

*Please visit KULASIS to find out about office hours.

[Courses delivered by instructors with practical work experience]

(1) Category

(2) Details of instructors' practical work experience related to the course

(3) Details of practical classes delivered based on instructors' practical work experience

Course number		U-ENG26 16003 LJ72			
Course title (and course title in English)	電気電子回路 Electric and Electronic Circuits		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Associate Professor, HISAKADO TAKASHI	
Target year	1st year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Mon.5	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
The first half of the course discusses the basics of three phase circuits, methods of analyzing passive circuits that include transformers, and the construction of systematic circuit formulas. The second half explains methods of analyzing circuits that include active components, such as transistors, using electric circuit theory, then describes the handling of frequency characteristics of circuits and basic switching operations of transistor circuits.					
[Course objectives]					
<ul style="list-style-type: none"> • Review basic knowledge on handling of electric circuits, and develop the ability to analyze basic electric circuits. • Understand the basics of three phase circuits. • Understand circuits that include independent voltage and current sources and controlled sources, as well as equivalent circuits of transformers. • Understand handling of frequency characteristics of circuits. • Understand methods to analyze nonlinear circuits including active components as linear circuits. • Understand the basic operation of semiconductor devices. 					
[Course schedule and contents]					
<p>(1-2) Basics of three phase circuits, [2 classes]: Following up on Basic Theory of Electric Circuits (60630), review the representation of sine waves in complex form, and explain the basics of single phase three wire circuits and symmetrical three phase circuits.</p> <p>(3-6) Passive circuit analysis methods, [4 classes]: Explain handling of circuits using Thevenin's theorem and Norton's theorem, equivalent sources and equivalent circuits. Explain mutual inductance and transformers; equivalent circuits, the coupling factor, ideal transformer, impedance conversion, analysis of circuits including transformers.</p> <p>(7-8) Circuit equations, [2 classes]: Explain construction of the loop equations and the nodal equations that can realize systematic circuit analysis even when very large number of elements are included.</p> <p>(9) Basics of semiconductor, [1 class]: Explain p-n junctions of semiconductors that make up diodes, transistors, etc., as well as their basic characteristics.</p> <p>(10-11) Active circuit analysis, [2 classes]: Explain DC biasing for linear operation of electron tubes, transistors, etc. as well as AC small signal equivalent circuits for handling amplification of signals, etc., and explain the concept of controlled voltage</p>					
----- Continue to 電気電子回路(2) -----					

電気電子回路(2)

sources and controlled current sources, and methods of analyzing electronic circuits using linear circuit theory.

(12-13) Frequency characteristics of electronic circuits, [2 classes]:

Explain dB (decibel) notation for representing the ratio of electric power, voltage, current, etc., and describe the frequency characteristics of simple amplifier circuits.

(14) Basics of semiconductors and binary operation of active circuits, [1 class]:

Describe transistor's switching operation.

(15) Confirmation of learning attainment, [1 class]:

Confirm the degree of learning attained in the course.

[Course requirements]

Students should have learned the content of Basic Theory of Electric Circuits (60630), or an equivalent basic course in electric circuits.

It is not required to have obtained credits from the above courses.

[Evaluation methods and policy]

Evaluation will be based on final examination grade.

Report topics will be assigned in class, and reports on these themes will be factored into the final grade.

Course number		U-ENG26 26010 LJ72					
Course title (and course title in English)	電子回路 Electronic Circuits			Instructor's name, job title, and department of affiliation		Graduate School of Engineering Associate Professor, SUGIYAMA KAZUHIKO	
Target year	2nd year students or above	Number of credits		2	Year/semesters	2025/First semester	
Days and periods	Fri.2	Class style	Lecture (Face-to-face course)		Language of instruction	Japanese	
[Overview and purpose of the course]							
Following the lecture of fundamentals of active device circuits in the course "Electric and Electronic Circuits", modeling of active devices, fundamentals of transistor circuits, various amplifier circuits, negative feedback in circuits, operational amplifiers, and oscillators are lectured. Nonlinear circuits, power supplies, and noise would be included in the course, when the lecture time remains.							
[Course objectives]							
The goal of this course is to acquire the fundamentals of electronic circuits. Starting with understanding of a fundamental concept of electronic circuits i.e., modeling of active devices, the lecture based on the fundamental concept proceeds step by step to understand electric circuits. In this style, the lecturer wants to give the students an ability to understand the principles of more complicated circuits by application of deep understanding the fundamentals. The main targets to be understood are the circuits with bipolar transistors and operational amplifiers, as well as the fundamental concepts.							
[Course schedule and contents]							
<p>Modeling of active devices (3 times): The essential concepts in the electronic circuit are lectured in order to treat active devices in the electric circuit theory. The concepts are the controlled source and the linearization. The decoupling between the bias and the signal, another important concept, is lectured.</p> <p>Fundamentals of transistor circuits (3 times) The characteristics of the basic bipolar-transistor circuits of three different common references are lectured based on the operation principle of the bipolar transistor. The biasing circuits are lectured with somewhat practical circuits.</p> <p>Various amplifier circuits (3 times) Several power amplifier circuits are lectured as we focus on their power efficiencies. DC amplifier circuits are lectured as we bear in mind that they are applied in operational amplifiers.</p> <p>Operational amplifiers (2 times): The concept and advantages of the negative feedback circuit are lectured, and an important concept in the operational amplifier, the virtual short, is explained. The linear operational circuits such as integrator and differential circuits, and nonlinear operational circuits such as logarithmic and exponential amplifiers are introduced.</p>							

Continue to 電子回路(2)							

電子回路(2)

Oscillators (2 times):

The principle of the oscillator circuit is lectured as a concept of the positive feedback. Various oscillator circuits are introduced with their characteristics.

Others (1 time):

If we have a more lecture time, nonlinear circuits of multiplier and modulation/demodulation circuits, power supplies for electronic circuits, and the noise in electronic circuits will be lectured.

Feedback (1 time):

We make an examination in order to investigate the achievement in the lecture. We will offer an additional chance for discussion to the students who do not achieve satisfactorily.

[Course requirements]

"Electric and Electronic Circuit (60030)" and "Fundamentals of Circuit Theory (60630)". (The lecturer recommends moderate understanding of fundamentals of electric circuit as the minimum prerequisites to achieve this course.)

[Evaluation methods and policy]

Examination and reports. Details about evaluation of the reports are opened on the homepage of this lecture located on Panda.

Course number		U-ENG26 26012 LJ72 U-ENG26 26012 LJ11			
Course title (and course title in English)	論理回路 Logic Circuits		Instructor's name, job title, and department of affiliation	Graduate School of Informatics Professor, HASHIMOTO MASANORI	
Target year	2nd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Fri.1	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This lecture covers analysis and design of logic circuits that form a basis of digital circuits such as processors. First, Boolean algebra, logic function and its minimization are explained. Then, analysis and design of combinational and sequential circuits are covered. Finally, arithmetic circuits for binary numbers are discussed.					
[Course objectives]					
From this lecture, you can obtain basic knowledge that enables the analysis and design of small-scale logic circuits both for combinational and sequential operations.					
[Course schedule and contents]					
Following topics will be covered. By assessing the understanding of the students and adding explanations and tasks when necessary, we will spend the number of weeks listed in [].					
(1) Basics of logic functions [2 weeks] Digital circuits and logic circuits, number systems, Boolean algebra, logic functions, and logical expressions are covered.					
(2) Logic minimization [4 weeks] Methods for logic minimization using Boolean cubes and Karnaugh maps, Quine-McCluskey method, properties of logic functions are explained.					
(3) Combinational circuit [2 weeks] Logic gates, analysis and design of combinatorial circuits, representative combinational circuits are discussed.					
(4) Sequential circuit [5 weeks] Operation and expression of sequential circuits, organization and operation of flip-flops, analysis and design of sequential circuits, synchronous counters and registers are explained.					
(5) Arithmetic circuit [1 week] The effect of delay and hazard in logic circuits are explained. Methods for binary addition and subtraction, organization and operation of binary adders are discussed.					
----- Continue to 論理回路(2)					

論理回路(2)

(6) Confirmation of understanding and feedback [1 week]

The level of understanding on this lecture will be confirmed. Feedback will be given if necessary.

[Course requirements]

None

[Evaluation methods and policy]

The level of achievement toward the goal of this lecture will be examined by a regular exam.

Course number	U-ENG26 26013 LJ72				
Course title (and course title in English)	情報理論 Information Theory		Instructor's name, job title, and department of affiliation	Graduate School of Informatics Associate Professor, SATO TAKEHIRO	
Target year	2nd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Tue.1	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This course discusses information storage (compression), and basic issues related to information transmission, especially information source coding and communication channel coding. Lectures also describe concrete error detection codes (cyclic codes, etc.) and error correction codes. The ABCs of information security are also touched upon.					
[Course objectives]					
Students will grasp basic concepts concerning information storage (compression) and transmission. They will also understand concrete error detection codes and error correction codes.					
[Course schedule and contents]					
<p>Information theory (1 class) Introduction to the history, aims, and current applications, etc., of information theory.</p> <p>Information source coding (4 classes) Explanation is provided of various types of communication channel models, including memoryless sources and Markov information sources, followed by discussion of information source coding theorems. Hu.man and Lempel-Ziv coding and other concrete information source coding methods are described.</p> <p>Channel coding theorems (2 classes) Mutual information and channel capacity are discussed, together with Shannon.s channel coding theorem.</p> <p>Error detection codes and error correction codes (5 classes) Detailed explanation is made of the principles of parity check code, Hamming code, and cyclic code. Also, based on knowledge of finite fields (Galois .eld), BCH code, etc., are introduced as multiple error correction codes.</p> <p>Information security (2 classes) Opportunities have increased for the electronic transmission, via networks, of important information. Explanation is provided of the coding that is essential to secure the safety of that information; special focus is given to basic items concerning public-key encryption systems, digital signatures and authentication, and other key issues.</p> <p>Confirmation of extent of student learning (1 class) Confirmation is made of the extent that students have learned the contents of this course.</p>					
[Course requirements]					
Knowledge of probability (probability theory fundamentals) and algebra is desirable.

Course number		U-ENG26 36026 LJ72			
Course title (and course title in English)	自動制御工学 Control Engineering		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Associate Professor, HOSOE YOUHEI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Tue.1	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This course covers a basic theory of feedback control for linear continuous-time systems in the frequency domain. The fundamentals of control systems are lectured on through such concepts as the Laplace transformation, transfer functions, block diagrams, transient responses, frequency responses, and stability criteria. The course proceeds in parallel to the contents of Chapters 1 through 4 and the former half of Chapter 5 of the textbook. The stress of the lecture, however, is placed on the theoretical framework, the basic concepts, and their interrelations. Hence some topics are left to the spontaneous studies of the class members, who are also supposed to work on assignments to have better understanding.					
[Course objectives]					
To understand the basic treatment of linear feedback systems in the frequency domain, particularly the Laplace transformation and its role, the transient responses, stability and performance evaluation of feedback systems, frequency responses, as well as their relations.					
[Course schedule and contents]					
Feedback systems and the Laplace transformation (4--5 weeks)					
Fundamental notions for feedback systems; history and roles of control technologies; the Laplace transformation as a key tool for dealing with feedback control systems, and transfer functions.					
Block diagrams and feedback control systems (3--4 weeks)					
Block diagrams and their equivalent transformations; the performance of feedback control systems and its evaluation; basic properties of feedback control systems and their roles observed through the analysis of step responses of simple examples.					
Transient responses and stability of systems (1--2 weeks)					
Transient responses of systems and algebraic stability criteria of feedback systems.					
Frequency responses (4--5 weeks)					
Frequency responses and their representation such as the vector loci and the Bode diagrams; manipulations of Bode diagrams; the Nyquist stability criterion, and stability margins. Checking degrees of understanding of all the lecture topics, e.g., through comments on the exam, closes the class.

Course number	U-ENG26 36027 LJ72				
Course title (and course title in English)	デジタル制御 Digital Control		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor, HAGIWARA TOMOMICHI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Tue.4	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This course covers a basic theory of digital control systems, based on the understanding on "Control Engineering". The treatment of discrete-time signals and linear discrete-time systems in the frequency domain is first introduced through the z-transformation and pulse transfer functions. Digital compensators as well as their programs and frequency responses, the stability and steady-state errors of closed-loop feedback systems, sampling period selection and anti-aliasing filters are then lectured on. The class members are supposed to understand the fundamental treatment of digital control systems through such concepts, who are also supposed to work on assignments about computational techniques to have better understanding.					
[Course objectives]					
To understand the basic treatment of digital control systems including their components and the associated difficulties and measures, particularly the z-transformation and its role, the discretization of controlled objects, the similarity to and differences from the analysis of continuous-time control systems, as well as aliasing.					
[Course schedule and contents]					
Fundamentals of digital control and the z-transformation (4--5 weeks)					
The fundamental structure of digital control systems and the associated issues; the z-transformation as a key tool for dealing with digital control systems; the frequency-domain interpretation of samplers and aliasing.					
Pulse transfer functions, frequency response, and digital compensators (4--5 weeks)					
Basic components such as hold circuits and pulse transfer functions; discretization of controlled objects; the pulse transfer functions and programs of digital compensators; transient responses of discrete-time systems; stability and frequency responses; and basic digital compensators.					
Closed-loop digital control systems (5--6 weeks)					
Analysis of digital control systems with pulse transfer functions through the discretization of the controlled object and disturbances; the stability, stability criteria and steady-state errors of closed-loop systems; basic standpoint for the disturbance rejection in digital control systems, sampling period selection and anti-aliasing filters. Checking degrees of understanding of all the lecture topics, e.g., through comments on the exam, closes the class.

Course number		U-ENG26 36031 LJ72			
Course title (and course title in English)	放電工学 Electric Discharge and Breakdown		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Associate Professor,YOSUKE ITOH Part-time Lecturer,HIROTSU KENICHI	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Tue.4	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This lecture mainly explains the discharge and dielectric breakdown phenomena in gases and the underlying mechanisms. The specific focus shall be on the collision phenomena, excitation and ionization processes, basic processes in ionizing gas (such as transport phenomena), discharge inception theory and Paschen's law, various discharge types (such as corona, glow, and arc), discharge in solids, and creeping discharge.					
[Course objectives]					
To deepen the understanding of basic discharge processes and discharge maintenance mechanisms; as well as thoroughly deepening the understanding of basic characteristics and engineering application fields of various discharge forms. Such knowledge is vital for professionals involved in electrical and electronic engineering.					
[Course schedule and contents]					
<p>1. Discharge in gas and its engineering role [1 week] (Hirotsu) Gas discharge phenomena are outlined, and the purpose of the lecture is described.</p> <p>2. Fundamental process in ionized gas [4 week] (Hirotsu) Fundamental process in ionized gas such as collision between gas molecules, excitation, ionization, transportation, recombination is described.</p> <p>3. Start of gas discharge [3 weeks] (Ito) Explanation of electron avalanche phenomenon when an electric field is applied to a gas, and description of the mechanism of discharge inception in a gas and Paschen's law. Moreover, the streamer theory will be explained.</p> <p>4. Steady gas discharge 1 (corona discharge, long gap discharge, lightning) [4 weeks] (Ito) Explanation of discharge form after a discharge starts. Here, each theory regarding discharge phenomena such as corona discharge, long gap discharge, and lightning discharge is described.</p> <p>5. Steady gas discharge 2 (glow discharge, arc discharge) [1 week] (Hirotsu) Explanation of various discharge forms after a discharge starts. Here, each theory of discharge phenomena such as glow discharge and arc discharge is described. Furthermore, explanation of the technology used for</p>

Course number	U-ENG26 36032 LJ72				
Course title (and course title in English)	通信基礎論 Modulation Theory in Electrical Communication		Instructor's name, job title, and department of affiliation	Graduate School of Informatics Professor, HARADA HIROSHI Part-time Lecturer, MIZUTANI KEIICHI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Wed.1	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This course discusses all types of modulation methods, that is, the theories of amplitude, frequency, phase, pulse modulations, as well as the principles of modulation/demodulation. Further focus is made on signal processing basics, sampling theory, etc., including of related applications.					
[Course objectives]					
Students will gain an understanding of the fundamentals of communication theory, used in mobile telephones, wireless local area networks (LAN), optical fiber communications, etc. Specifically, students will master signal expression and signal processing (modulation/demodulation) within time axis and frequency axis of communication signals, chiefly in the physical layers of communication signals.					
[Course schedule and contents]					
<p>"Signal processing (4-5 classes)</p> <p>Clarification is made of the concept of " frequency, " and students learn of tools for handling frequency, namely, Fourier series and Fourier transforms and their practical applications. Discussion is next made especially of the basics of random signals and theories regarding the standardization and quantization of random signals.</p> <p>Analog modulation and demodulation methods (5-6 classes)</p> <p>Discussion is made of the principles of amplitude modulation and angle modulation and their generation and modulation methods, with comparison of their respective characteristics, including occupied bandwidth and signal-to-noise ratio, etc.</p> <p>Digital modulation and demodulation methods (4-5 classes)</p> <p>After description of various methods of pulse modulation, there is discussion of principles and methods of digital modulation types, including modulation phase shift keying (PSK), etc., plus the basics of signal space. Confirmation is made of the extent of student understanding, with supplementary discussion to further improve levels of understanding.</p> <p>Confirmation of extent of student learning (1 class)</p> <p>Confirmation is made of the extent that students have learned the contents of this course. Additional explanation is provided for those students whose understanding remains incomplete or imperfect.</p>

[Overview and purpose of the course]					
We will introduce mobile cellular systems, wireless LANs, Ethernet, optical disks, etc. as specific applications of information transmission. We also discuss issues in the design of each system and their solutions.					
[Course objectives]					
Students will gain an understanding of fundamental concepts involving highly reliable information transmissions via communication channels with noise and interference.					
[Course schedule and contents]					
<p>(1) Communication systems (3 weeks) Lectures discuss general configurations for communication systems and wireless communication systems, as well as link budget and channel capacity.</p> <p>(2) Optical disks and Ethernets (2 weeks) Discussions are made of pulse-code modulation (PCM) and baseband transmission required for understanding optical disks and Ethernets.</p> <p>(3) Multiple access for wireless systems (2 weeks) Discussions are made of multiplexing, multiple access, channel allocation, and user scheduling, which are necessary for mobile cellular systems and wireless LANs.</p> <p>(4) Cellular systems (1 week) We describe the cellular system that realizes wide area public wireless service and introduce the concept of clusters and handovers.</p> <p>(5) Fading, and countermeasure techniques (2 weeks) We introduce a typical model of fading in urban areas and countermeasure techniques, including diversity, etc.</p> <p>(6) High-speed and high-efficiency technologies (2 weeks) We introduce orthogonal frequency division multiplexing (OFDM) as high-speed transmission technologies.</p> <p>(7) Spectral efficient technologies (2 weeks) We introduce multiple-input and multiple-output (MIMO) transmission as spectral efficient technologies.</p>					
Continue to 情報伝送工学(2)					

情報伝送工学(2)

(8) Confirmation of extent of student learning (1 week)

Confirmation (i.e., evaluation) is made of the extent that students understand the concepts involved in highly reliable information transmissions.

[Course requirements]

Students are recommended to have taken "Modulation Theory in Electrical Communication".

[Evaluation methods and policy]

【Evaluation method】

Written examination (up to 100 points), reports or exercises (total of 0 or 1 times, maximum of 5 points each) are carried out, and the total points (up to 100 points) are evaluated.

【Evaluation criteria】

Evaluation is based on the achievement level of the target.

Course number		U-ENG26 36034 LJ72			
Course title (and course title in English)	通信ネットワーク Telecommunication Networks		Instructor's name, job title, and department of affiliation	Graduate School of Informatics Professor, Oki Eiji Graduate School of Informatics Associate Professor, SATO TAKEHIRO Part-time Lecturer, Part-time Lecturer, UNNO YUUSUKE Part-time Lecturer, KOYABU MASAYA	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Mon.2	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Lectures describing fundamental concepts related to communications networks such as circuit and packet switching, transmission control, network control, and communication protocols, as well as examples of a variety of communication networks ranging from access systems such as the Internet, wireless LAN, and FTTH.					
[Course objectives]					
Cultivate an understanding of the basics of communication network technologies to apply to current trends.					
[Course schedule and contents]					
<p>Foundations of the exchange method and traffic theory, 3 sessions These sessions will focus on trends in switching technology and the basic theory of traffic analysis.</p> <p>Wide area network technology and its applications, 3 sessions These sessions will focus on discussion of the structure of communication networks as an infrastructural component and various technical elements (exchanges, relay, wireless technologies, etc.) constituting the network.</p> <p>Internet communication, 3 sessions These sessions will aim to develop proficiency in the basic knowledge required for packet data communication and typical communication protocols.</p> <p>LAN and protocols, 2 sessions These sessions will discuss various access protocols and a local area network (LAN) using them.</p> <p>Case study and development exercises, 3 sessions These sessions will introduce the current trends in information communication services and systems, with examples of the application of IP nets, wireless LANs, and mobile IT systems, as well as analyze a number of case studies.</p> <p>Confirmation of learning achievement, 1 session</p>					
<div style="text-align: right;">Continue to 通信ネットワーク(2)</div>					

通信ネットワーク(2)

Confirm (evaluate) achievement of the learning objectives of the course.

[Course requirements]

Having previously studied basic communication theory is desirable.

[Evaluation methods and policy]

Students will be comprehensively evaluated regarding their basic understanding of communication network technology based on regular examinations, reports, and exercises.

Specifically, regular examinations will be evaluated on a 100-point scale, and a maximum of 5 points will be added for each report and exercise assignment submission, for a total overall course score of up to 100 points.

[Textbooks]

Other, handouts will be distributed

Course number		U-ENG26 46036 LJ72			
Course title (and course title in English)	マイクロ波工学 Microwave Engineering		Instructor's name, job title, and department of affiliation	Research Institute for Sustainable Humanosphere Professor,SHINOHARA NAOKI Research Institute for Sustainable Humanosphere Associate Professor,MITANI TOMOHIKO	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Tue.2	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Theory and applications of microwave transmission line , microwave passive circuits, active circuits, and microwave tubes are given. Applications of thier devices and elements for mobile phones, radar and wireless power transmission are given.					
[Course objectives]					
The course goal is to understand the principle of microwaves and microwave circuits and to understand the principle of mobile phones and the other microwave applications.					
[Course schedule and contents]					
<p>General concepts,1-2times,After confirmation of Maxwell's equations and wave guide theory, general concepts of microwave enginnering are presented as introduction of the following theme.</p> <p>Circuit theory of transmission line,2-3times,Characteristics of microwave transmission line and circuit theory of transmission line are given. Impedance matching and Smith Chart are given.</p> <p>Microwave passive circuits,2-3times,Connector, circuit device in waveguide, impedance matching load, attenuator, phase shifter, T-blanch, isolator, circuiator, directional coupler, power divider/combiner are given.</p> <p>Microwave resonator and filter,2-3times,Microwave resonator and filter are given.</p> <p>Microwave tubes,1-2times,Generation/amplifier mechanism of microwave tubes of Klystron, TWT, magnetron are given.</p> <p>Microwave active circuits and semiconductor devices,2-3times,Diode as microwave passive semiconducotor and FET and HBT as microwave active semiconductors are given. Its applications like Parametric amplifier are given.</p> <p>Microwave Applications,3-4times,Theory, requirements, and typical components of RF circuits in mobile communication are given. The other applications of radar, microwave heating, and wireless power transmission are given.</p> <p>Confirmation of Understanding,1time,Student's understanding of this lecture is confirmed. Opportunity of feed-back lecture is given if the studen's understanding is not enough.</p> <p>The order of instruction for each topic and subtopic may vary, and the course instructors will organize the lectures as appropriate for the students. Students will be informed of the lecture plan (for all 15 lectures) in advance and will have sufficient time for preparation.</p>

Course title (and course title in English)	固体電子工学 Solid-State Electronics		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Program-Specific Professor, ASANO TAKASHI Graduate School of Engineering Professor, DE ZOYSA, Menaka	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Wed.2	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
There are various devices which make use of electrons and photons in solid state (or materials). The examples are solar cells, semiconductor lasers, and transistors. These devices are indispensable for all areas of technologies, and thus regarded as brains in society. In this lecture, we explain various phenomena based on electrons and photons in solid states, where the focus is on the interaction between solid states and photons via electron transitions.					
[Course objectives]					
Understanding of fundamental of band structures in solid state and the related phenomena such as light absorption and amplification based on the electron transitions between valence and conduction bands.					
[Course schedule and contents]					
<p>Overview of solid-state electronics, 1 time, After the explanation of progress in electronics based on solid-state electronics, we show the contents of this lecture.</p> <p>Fundamentals of solid-state electronics, 1~2 times, First, we explain the method to derive band structure of solid state using Kronig-Penney model. Then, we describe various fundamental concepts in solid state, such as density of states, phonons, etc.</p> <p>Photon absorption in solid state, 4 times, We will explain the mechanism of photon absorption in solid state and derive some equations to express the absorption quantitatively.</p> <p>Amplification of light, 2~3 times, We will explain the mechanism of optical amplification and derive some quantitative equations.</p> <p>Various photonic devices, 3~4 times, Various photonic devices based on the above discussions are given, such as solar cells, semiconductor lasers, etc.</p> <p>Verification of understanding, 1 time, We confirm whether the students can understand the above subjects.</p>					
[Course requirements]					
It is desirable to learn some related lectures such as semiconductors, fundamental of material and devices, etc.					
[Evaluation methods and policy]					
Examination and submission of a few reports					
[Textbooks]					
Note style

Course title (and course title in English)	電気電子材料学 Electrical and Electronic Materials		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Associate Professor, KOBAYASHI KEI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Wed.3	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
<p>This course explains various functions and properties of electrical and electronic materials based on their microscopic structure and characteristics. The course covers a range of materials, including dielectrics, magnetic materials, and organic/polymeric materials, elucidating the microscopic origins of their distinctive properties such as dielectric properties, magnetism, organic electronic properties, etc., from the perspectives of electromagnetics and quantum mechanics. Additionally, it provides an overview of the relationship between nanotechnology and the field of materials.</p>					
[Course objectives]					
<p>The goal is to understand various functions and properties of electrical and electronic materials based on their microscopic structure and characteristics, and to learn about the connection between nanotechnology and the field of materials.</p>					
[Course schedule and contents]					
<p>Electronic materials in daily life (1) Overview of electronic materials used in everyday electronic components such as conductors, semiconductors, dielectrics/insulators, magnetic materials, and organic/polymeric materials.</p> <p>Microscopic origin of electronic material properties (1) Overview of the classification and properties of various electronic materials, explaining the similarities between dielectrics and magnetic materials and describing the origin of the dipoles constituting them.</p> <p>Electronic properties of dielectrics (5) Explanation of the mechanisms behind the formation of various polarizations underlying dielectric properties and the dielectric dispersion relation associated with these polarization mechanisms. Also, a brief overview of the fundamental properties of piezoelectric, ferroelectric, and pyroelectric materials.</p> <p>Quantum mechanics of atoms and molecules (3) In the context of magnetic materials, exploration of how the electron system bound to the atoms composing the material induces magnetism. After a brief explanation of the fundamentals of quantum mechanics, quantum-mechanical treatment of a simple bound electron system, such as the hydrogen atom, is discussed to describe the basic properties of the electron system.</p> <p>Angular momentum and spin (2) Explanation of the fundamental properties of angular momentum and introduction of the concept of electron</p>					
<p style="text-align: right;">Continue to 電気電子材料学(2)</p>					

電気電子材料学(2)

spin through the algebraic representation of angular momentum. Learning of basic calculation methods and synthesis methods related to angular momentum and spin.

Magnetism (2)

Explanation of disordered magnetism such as paramagnetism and antiferromagnetism. Description of exchange interactions and discussion of ordered magnetism like ferromagnetism and antiferromagnetism.

Confirmation of learning achievements (1)

Verification of the learning achievements regarding the electronic properties of dielectrics and magnetic materials, as well as the microscopic origins of these properties discussed during the lectures.

[Course requirements]

A basic knowledge of mechanics and electromagnetics is desirable.

[Evaluation methods and policy]

Evaluation will primarily be based on periodic examinations (out of 100 points), with a passing grade set at 60 points or above.

[Textbooks]

Not used. Supplementary materials will be distributed as needed.

[References, etc.]

(Reference books)

Some books may be introduced on request.

[Study outside of class (preparation and review)]

Lectures will be presented through blackboard writing, with supplementary materials distributed as necessary. Due to the progression of lectures, explanation of derivation process of formula may be omitted; in such cases, individuals are encouraged to confirm the derivation process on their own.

(Other information (office hours, etc.))

Depending on the progress of the lecture for the academic year, some parts of the lecture content may be omitted. Additionally, there may be occasional changes to the lecture sequence.

*Please visit KULASIS to find out about office hours.

Days and periods	Tue.2	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Lectures focusing on wave optics, which is an important aspect of study in the field of optoelectronics. Specifically, the fundamental properties of light waves, optical phenomena such as refraction, transmission, reflection, interference, diffraction as well as the analysis of each, and the fundamentals of fourier optics. In addition, the principles of basic optical devices and elements that apply these phenomena will also be covered.					
[Course objectives]					
Cultivate an understanding of the basic principles of light waves.					
[Course schedule and contents]					
<p>Overview of optical engineering, 1 session These sessions will discuss the historical development and engineering significance of this field brought about by the emergence of lasers after providing examples of the relationship between optical engineering and everyday applications of optoelectronics.</p> <p>Basic properties of light waves, 2-3 session These sessions will describe the fundamentals of the treatment of light wave propagation in isotropic and anisotropic media based on Maxwell ' s equations and explain light wave polarization.</p> <p>Light wave refraction/transmission/reflection, 3-4 sessions These sessions will discuss total reflection and optical elements as applications after taking up non-absorbing media and explaining the Snell and Fresnel formulas which form the basis for understanding the phenomena occurring at the boundary between two different media. Lectures will also discuss the behavior of light waves in absorbing media.</p> <p>Interference and coherence, 3-4 sessions These sessions will discuss the concept of coherence of light with respect to interference between two light waves as well as the basic concepts guiding the operation of optical devices such as Michelson interferometers, spectrometers, Fabry-Perot optical resonators, and thin-film optical devices using interference phenomena. In addition, the principle of a laser oscillator will be described as one application of optical resonators.</p> <p>Light wave diffraction, 3-4 sessions These sessions will introduce the concept of spatial frequency and discuss the treatment of light wave diffraction by Fourier transform based on the fundamental theory of scalar diffraction with specific examples</p>

Course number	U-ENG26 46056 LJ72				
Course title (and course title in English)	光電子デバイス工学 Optoelectronic Devices		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Program-Specific Professor, ASANO TAKASHI	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Mon.4	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
As the foundation for solid-state electronic engineering and semiconductor engineering to be taken by third-year students, detailed discussion is made of the theory of operations of various types of optical and electronic devices. Detailed explanation begins with the fundamentals of operations theory in optical devices.					
[Course objectives]					
Students will understand the physical background of spontaneous emission processes, as well as various elements essential when considering spontaneous emission processes in semiconductors.					
[Course schedule and contents]					
<p>Basic light emission processes (4-5 classes)</p> <p>An overview is made of spontaneous emission processes in two-level electron systems. Explanation is then made of Fermi ' s golden rule, electric dipole interactions, density of light (photon) states, etc. Finally, theoretical expression of the light-emitting relaxation rate is derived.</p> <p>Light emission processes from semiconductors (4-5 classes)</p> <p>An overview is presented of the processes from energy input to a semiconductor, to light emission. Next, the physics of light-emitting devices are explained.</p> <p>Using electron-hole state density and distribution functions, etc., theoretical formulas of emission spectra in the steady state are derived. Rate equations describing the transient state are also derived, with explanation of the elements that determine luminous efficiency.</p> <p>Control of electron state and emission characteristics (4-5 classes)</p> <p>Light-emission characteristics can be controlled via control of the electron states of a semiconductor light-emitting device. Explanation especially focuses on methods of improving emission characteristics by using quantum structure. Various quantum structures using semiconductor heterostructure are discussed. Explanation is also made of methods of calculating quantization level and of electron devices that use quantum structure.</p> <p>Confirmation of extent of student learning (1 class)</p> <p>Confirmation is made of the extent of student learning.</p>

[Study outside of class (preparation and review)]

Review of course material is recommended as lectures are designed for note-taking.

Lasers are everyday devices. It is hoped that studying topics and areas of practical interest, such as application examples, will help lead to understanding of the basic content of the lecture.

(Other information (office hours, etc.))

Some lecture contents may be omitted.

*Please visit KULASIS to find out about office hours.

Course number	U-ENG26 46058 LJ72				
Course title (and course title in English)	電気法規 Laws and Regulations of Electric Power Engineering		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor,MATSUO TETSUJI Part-time Lecturer,OTA TAKAYUKI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Intensive, First semester
Days and periods	Intensive	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This course discusses the main thrust of electricity-related laws and ordinances, explaining their relationship with energy, environmental problems, and so on, with a focus on the Electric Utility Industry Law.					
[Course objectives]					
By learning about laws concerning the electricity business, learn details on regulation of energy supply technologies and their safety, and gain the knowledge needed to be certified as an energy supply technician.					
[Course schedule and contents]					
<p>"1. History of the electricity business and law/electrical equipment technical standards (1 class)</p> <p>Explain the history of the electricity business and its relationship to various laws and ordinances, the role the electricity business has played, electrical safety, changes in electrical equipment technical standards, the content of regulations, their legal positioning, and so on.</p> <p>2. Quality of electric power (2 classes)</p> <p>Explain the quality of electric power and related laws and ordinances, referencing trends in electric power technologies. Also, to accurately understand present conditions in the electricity business and the quality of electric power, take a field trip to an electric power facility.</p> <p>3. Electric power system applications (1 class)</p> <p>Explain the electric power system and supply-demand management. Also, discuss the role of electric supply facilities and disaster rehabilitation measures, including a field trip to a facility.</p> <p>4. Electric power liberalization and nuclear energy (1 class)</p> <p>Explain challenges related to the electricity business, the trend toward deregulation and liberalization of electric power, and the current state of affairs of nuclear power generation.</p> <p>5. The global environment and energy conservation/alternative energy (1 class)</p>					
<div style="text-align: right;">Continue to 電気法規(2)</div>					

電気法規(2)

Explain global environmental issues such as global warming, as well as electricity business initiatives aiming to achieve a low-carbon society, such as alternative energy, smart grids, and energy conservation.

6. Confirmation of learning attainment (1 class)

Confirm the degree of learning attained with regard to the course overall."

[Course requirements]

Basic information concerning electricity generation, electricity transmission, electricity transformation, and electricity distribution.

[Evaluation methods and policy]

Grade is based on the number of classes attended and score on the examination (administered at the final class meeting).

[Textbooks]

In addition, printouts

[References, etc.]

(Reference books)

[Study outside of class (preparation and review)]

Will be discussed as needed.

(Other information (office hours, etc.))

[Courses delivered by instructors with practical work experience]

(1) Category

A certificate-bearing course that includes practical classes related to the certificate.

(2) Details of instructors ' practical work experience related to the course

(3) Details of practical classes delivered based on instructors ' practical work experience

Course number		U-ENG26 46059 LJ72					
Course title (and course title in English)	電波法規 Laws and Regulations of Radio Wave Engineering			Instructor's name, job title, and department of affiliation		Research Institute for Sustainable Humanosphere Professor,SHINOHARA NAOKI Part-time Lecturer,ASAIMASAMITSU	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/Intensive, Second semester		
Days and periods	Intensive	Class style	Lecture (Face-to-face course)		Language of instruction	Japanese	
[Overview and purpose of the course]							
In recent years, radio wave technology such as satellite communication, cellular phones, wireless LAN, and so on has been remarkably developed. In postwar Japan, radio wave administration is promoted mainly on the basis of the Radio Law and the Broadcast Act. In particular, the Radio Law, which aims to promote public welfare by ensuring the fair and efficient utilization of radio waves (Article 1), fulfills a key role in a society that uses radio waves. This course discusses the establishment of radio wave legislation and basic matters on the Radio Law and its related laws and regulations. This is a required course for those wishing to obtain qualification as the First Class On-The Ground Special Radio Operator or the Third Class Maritime Special Radio Operator.							
[Course objectives]							
The purpose of this course is to gain an understanding of basic matters concerning the establishment of Japanese radio wave legislation and laws and regulations related to radio waves.							
[Course schedule and contents]							
<p>Overview of the Radio Law, 1 class: Discuss the foundational principles of the Radio Law, the structure of its provisions, its subjects of regulation, its relationship with international laws, as well as other laws and ordinances, definitions of terms, classification of radio stations, and so on.</p> <p>History of radio wave legislation, 1 class: Discuss the history of radio wave legislation beginning in the dawn of radio wave technology, postwar history of the Radio Law, the Broadcast Act, and the Act for Establishment of Radio Regulatory Commission.</p> <p>Basic matters on the Radio Law, 10 classes: Licensing and registration of radio stations, reasons for disqualification, licensing procedures, blanket licensing, etc.; Radio operator qualification, radio operator in charge; Technical regulations of radio equipment, Technical Regulations Conformity Certification, Model Examination of Radio Equipment etc. ; Basic principles of radio station operation, retained documents, etc., communication methods, etc.; Supervision, inspection of radio stations, radio propagation blockage prevented area, radio wave usage fees; Overview of related laws and regulations.</p> <p>On recent law amendments, 1 class: Explain major recent amendments.</p> <p>Actual operation of radio stations, 2 classes: Explain the actual examples of radio stations such as experimental stations and their related regulations.</p>

Course number		U-ENG26 26060 LJ11 U-ENG26 26060 LJ72			
Course title (and course title in English)	デジタル回路 Digital Circuits		Instructor's name, job title, and department of affiliation	Graduate School of Informatics Professor, NIITSU KIICHI Graduate School of Informatics Associate Professor, UENO REI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Thu.2	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This lecture covers basics of digital circuits. First, fundamental properties of digital signals such as frequency characteristics, transmission and shaping of digital signals will be explained. Next, switching operation of semiconductor devices such as diodes, bipolar transistors and MOS transistors will be examined. Finally, circuit structure and performance of logic gates and memories for digital integrated circuits will be discussed.					
[Course objectives]					
From this lecture you can understand basic properties of digital signals and linearized circuits. To understand operating principles, circuit performance, and design method of logic gates and memories.					
[Course schedule and contents]					
Following topics will be covered. By assessing the understanding of the students and adding explanations and tasks when necessary, we will spend the number of weeks listed in [].					
(1) Basic properties of digital signals [2 weeks] ,Frequency spectrum of digital signals and step response of linearized ircuit will be explained.					
(2) Transmission of digital signals [2 weeks] Signal transfer characteristics of loss-less transmission lines will be explained. Lossy transmission lines will also be covered.					
(3) Switching characteristics of semiconductor devices [3 weeks] DC and transient characteristics of pn junction diodes, bipolar transistors, MOS transistors will be explained.					
(4) Waveform shaping of digital signals [1 week] Waveform shaping circuits such as a clipper, limiter, and Schmitt-trigger circuits will be explained.					
(5) Bipolar digital circuits [2 weeks] Basic logic gates using bipolar transistors are explained. First, DC and transient characteristics of an bipolar inverter circuit will be analyzed. Next, circuit configuration, operating principle and circuit performance of an ECL gate will be discussed.					
(6) MOS digital circuits [3 weeks] Basic logic gates using MOS transistors are explained. Circuit configuration, operating principle and circuit					
----- Continue to デジタル回路(2) -----					

デジタル回路(2)

performance of a complementary logic gate, a complex logic gate, and a dynamic logic gate will be discussed.

(7) MOS memory circuits [1 week]

Circuit configuration of ROM and RAM will be explained.

(8) Confirmation of understanding [1 week]

The level of understanding on this lecture will be confirmed. Feedback will be given if necessary.

[Course requirements]

Semiconductor Engineering, Logic Circuits, Electronic Circuits

[Evaluation methods and policy]

The level of achievement toward the goal of this lecture will be examined by a regular exam.

[Textbooks]

Hand-outs will be provided.

[References, etc.]

(Reference books)

Introduced during class

[Study outside of class (preparation and review)]

Plactices in the handout should be solved after the corresponding topic is covered by the lecture.

Course number		U-ENG26 36061 LJ72			
Course title (and course title in English)	デジタル信号処理 Digital Signal Processing		Instructor's name, job title, and department of affiliation	Research Institute for Sustainable Humanosphere Associate Professor, YOKOYAMA TATSUHIRO	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Mon.4	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
The goal of this lecture is to understand fundamental theories and filter designs for one-dimensional time-domain signal and two-dimensional image processing. In particular, this course provides introductions to sampling theorem, orthogonal transformation such as discrete Fourier transform, fast Fourier transform algorithms, and FIR and IIR filters based on the discrete-time linear time invariant system theory.					
[Course objectives]					
Theoretical development from continuous-time (Laplace transform, Fourier transform, etc.) to discrete-time (Discrete Fourier transform, Fast Fourier transform, Z-transform, etc.) will be learned. Digital signal processing requires both theoretical analysis / design and practical software system implementations. This course provides exercises on signal processing in Python.					
[Course schedule and contents]					
<p>Overview of digital signal processing (1)</p> <ul style="list-style-type: none"> * Introduction of the goal of digital signal processing, its essential ideas and advantages. <p>Sampling and Fourier transform (3)</p> <ul style="list-style-type: none"> * Fourier transform in continuous time signal, sampling theorem and discrete Fourier transform. <p>Fast Fourier transform and orthogonal transforms (1)</p> <ul style="list-style-type: none"> * Fast Fourier transform (FFT). * Discrete cosine transform. <p>Short-time Fourier transform and multi-scale signal analysis (1)</p> <ul style="list-style-type: none"> * Short-time Fourier transform. * Multi-scale signal analysis and wavelet transforms. <p>Discrete-time systems (2)</p> <ul style="list-style-type: none"> * Laplace transform in continuous-time system. * Discrete-time linear time-invariant system and z transform. <p>Digital filtering (3)</p> <ul style="list-style-type: none"> * FIR and IIR filters * Basics on linear phase FIR filter and IIR filter design. 					

Continue to デジタル信号処理(2)					

デジタル信号処理(2)

Time-series analysis and radar signal processing (2)

* Introduction to time-series analysis.

* Signal processing for radar systems.

Statistical signal processing filter (1)

* Introduction to statistical signal processing filter.

* Basics of Wiener filter and Kalman filter.

Exercise and feedback (1)

* Programming and exercise in Python.

[Course requirements]

Basic knowledge of Laplace and Fourier transforms and taking Fundamental Communication Theory are prerequisites for this course. Taking Digital Control in the same semester is also recommended.

[Evaluation methods and policy]

Grade evaluations will be based on scores in the written final examination (80%) and report assignments for programming exercises (20%).

Course title (and course title in English)	パワーエレクトロニクス Power Electronics		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor,SUSUKI YOSHIHIKO Graduate School of Engineering Assistant Professor,MOCHIYAMA SHIU Part-time Lecturer,CASTELLAZZI , Alberto	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Mon.1	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Power electronics is a field of research for the conversion and control of electric power using semiconductor devices. The objective of this course is to provide students with an understanding of the fundamentals of power conversion and control technology, and to develop their application. First, the basic theory of power conversion using switching circuits, including the operation of switching elements and circuits, is explained in detail. Then, the fundamentals of various power conversion and control technologies and their applications to motor control, etc. are explained in both Japanese and English.					
[Course objectives]					
Students will understand the fundamentals of power electronics based on electrical/electronic circuits, and semiconductor engineering, and be able to develop their applications.					
[Course schedule and contents]					
1. Outline of electrical energy engineering and power electronics 2. Fundamental of switching circuits (1/2) 3. Fundamental of switching circuits (2/2) 4. DC/DC converters (1/2) 5. DC/DC converters (2/2) 6. Theory of power modulation (1/2) 7. Theory of power modulation (2/2) 8. Rectification and inversion; single-phase two-level (2L) inverter (DC-AC converter) with sine-triangle PWM (neutral point and full-bridge version; comparison and discussion) 9. Three-phase 2L inverter; hints at voltage/current-frequency control; hints at space-vector modulation techniques 10. Design exercise (simulation-based) on single-phase and three-phase 2L inverter using sine-triangle PWM; discussion on Power Factor and its implications 11. Multi-level inverters: neutral point clamped, flying cap, and hybrid; hints at the Modular Multi-Level Converter (MMC) 12. Passive and active single-phase and multi-phase rectifiers; power factor considerations, power factor correction circuits (with simulation-based exercise) 13. Direct AC-AC (matrix) conversion 14. Electro-magnetic compatibility; differential and common mode filtering 15. Feedback

Course title (and course title in English)	電気電子工学概論 Introduction to Electrical and Electronic Engineering		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Associate Professor,HOSOE YOUHEI Graduate School of Energy Science Associate Professor,IWAO KAWAYAMA Institute of Advanced Energy Associate Professor,KOBAYASHI SHINJI Graduate School of Science Associate Professor,ETO YUJIRO	
Target year	1st year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Wed.4,5	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
By understanding the activities conducted in the laboratories that belong to the Electrical and Electronic Engineering Course, the students learn what is the electrical and electronic engineering. Except the first time in the beginning of this course, the students will investigate the activities in the lab and have a presentation of their investigations. The students are expected to deeply understand the activities by actively investigating them by themselves and by explaining the results to other students. The students are also expected to make acquaintance with teachers and senior students (in the final year, and in master or PhD course) in the lab, and to recognize that it is essential to understand the contents lectured in the basic courses that they will learn in the first and second year, thorough the investigation of the lab and special lectures. The class will be usually conducted every two weeks and continue for two lecture-units in each lecture day. The class number of times in the table below shows the number of the lecture days.					
[Course objectives]					
The goal of this lecture is that the students view how he or she will develop the field of the electric and electronic engineering and simultaneously how they develop their faculties in the field. For this purpose, the students will make teams, and each team will investigate the activity of a laboratory that belong to the Electric and Electronic Engineering Course. The teams cover all of the labs, and the students will share the results of their investigations through the presentation. Then, they will acquire an overview of the field of the electric and electronic engineering.					
[Course schedule and contents]					
Overview (1 time): A overview of the education that will be provided in the Electric and Electronic Engineering Course is lectured. After an introduction of how to proceed this course, the teams for investigation of each laboratory are announced.					
Visiting laboratory A (1 time): Each team visits the assigned laboratory A that belongs to the Electric and Electronic Engineering Course, and investigates the activities in the lab.					
Visiting laboratory B (2 times): Each team visits the assigned laboratory B that belongs to the Electric and Electronic Engineering Course, and investigates the activities in the lab.					
----- Continue to 電気電子工学概論(2) -----					

電気電子工学概論(2)

Preparation of presentation (2 times):

The students prepare a poster presentation to introduce the activities in the laboratory B that they visit and investigate.

Presentation (1 time):

Each team performs a poster presentation. The students learn the activities in the laboratories that belong to the Electric and Electronic Engineering Course from the poster presentations of the other teams.

[Course requirements]

None

[Evaluation methods and policy]

The grading is conducted by evaluation of various points, including the attendances at the lectures, the visit to the laboratories, and the presentation; the scores of the report; the score of the presentation.

[Textbooks]

The materials will be distributed.

[References, etc.]

(Reference books)

The materials will be distributed.

[Study outside of class (preparation and review)]

A report should be prepared before visiting each laboratory. The student should summarize three keywords related to each laboratory. The three keywords will be announced at Overview.

(Other information (office hours, etc.))

There is a possibility that some parts of the lectures would be removed or some new lectures would be additionally included, according to the total class number of times.

*Please visit KULASIS to find out about office hours.

Course number		U-ENG26 36081 LJ72			
Course title (and course title in English)	電気電子工学のための量子論 Theory of Quantum for Electrical and Electronic Engineering		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor, TAKEUCHI SHIGEKI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Wed.4	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Quantum mechanics describes the behavior of electrons and photons and forms the foundation of natural law. It is also essential for understanding current electronic devices and various advanced quantum technologies such as quantum computers and quantum cryptography. In this lecture, we explain basic matters on quantum mechanics. After discussing the collapse of classical mechanics and old quantum theory, the Schrödinger equation and some solutions will be explained. After that, we discuss the general properties of the wave function and the uncertainty principle. In addition, the basics of quantum information science will be overviewed.					
[Course objectives]					
To grasp the physical image of the behavior of quanta. Specifically, we aim to understand fundamental concepts of quantum mechanics such as superposition state, uncertainty principle, quantum entanglement, etc. and to be able to perform some basic calculations using wave functions.					
[Course schedule and contents]					
1. Overview and old quantum theory (2 ~ 3times) After describing general features and applications of quantum mechanics, we explain the collapse of classical mechanics and the old quantum theory.					
2. Schroedinger equation (4 ~ 6times) We introduce the Schrödinger equation and discuss its eigenvalue problems of two dimensional and three dimensional potential well.					
3. Dynamics of quanta (1 ~ 2 times) We discuss the dynamics of quanta using time evolution operator.					
4. General properties of wave functions (3 ~ 4times) In order to discuss the general properties of wave functions, we introduce a complex linear space (Hilbert space) and explain orthogonality of wave functions and operators. In addition, the uncertainty principle will be discussed.					
5. Basics of quantum information technology (1 ~ 2times) The basics of quantum information technology is overviewed.					
<div style="text-align: right;">Continue to 電気電子工学のための量子論(2)</div>					

電気電子工学のための量子論(2)

[Course requirements]

Basic knowledge of linear algebra, Fourier analysis, differential equation, dynamics, electromagnetism.

[Evaluation methods and policy]

Evaluate (From 0 to 100 points) comprehensively by regular test (60%), quizzes during lectures(20%), and some reports(20%). The submission of the reports are in principle mandatory.

[Textbooks]

竹内繁樹 『量子力学講義ノート』（サイエンス社,2024年）ISBN:978-4-7819-1597-5（ This textbook is written in Japanese. ）

[References, etc.]

（ Reference books ）

Some textbooks for reference will be introduced during the lecture.

[Study outside of class (preparation and review)]

Preliminary review and review are indispensable. Some report tasks will be given (mandatory).

（ Other information (office hours, etc.) ）

Depending on the progress situation, the order of lecture items may be changed or some may be omitted.

[Courses delivered by instructors with practical work experience]

(1) Category

A course with practical content delivered by instructors with practical work experience

(2) Details of instructors ' practical work experience related to the course

The professor have been involved in the research of quantum information technology at a company.

(3) Details of practical classes delivered based on instructors ' practical work experience

In this lecture, how quantum theory has been used in society will be discussed.

Course number	U-ENG26 26101 LJ72				
Course title (and course title in English)	電気電子計測 Electric and Electronic Measurement		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Associate Professor, OKAMOTO RYOU	
Target year	2nd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Fri.3	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
The basics of the measurement of electrical and magnetic quantities will be explained. First we describe the general theory of the measurement, to explain the principles of the various measurement methods and measuring instrument on the amount of electricity. In addition, as electrical and electronic application measurement, optical measurement will be overviewed.					
[Course objectives]					
Understand the basics of the electrical and electronic measurements.					
[Course schedule and contents]					
Standards and traceability, 2 times, The general theory of the measurement, the unit system, outlined of measurement standards and traceability. Error and evaluation of the measurement data, 2 ~ 3 times, The concept of error and uncertainty, as well as the basic evaluation method of measurement data such as regression analysis Analog and digital signal processing, 2 ~ 3 times, Amplification circuit using an operational amplifier (OA), DA and AD conversion, and Fourier transform. measurement technologies for electrical quantities, 5 ~ 6 times, The most basic is to explain the principles of the instruction type electric instrument, described voltage, current, power, the electrical quantities of the measurement method of the power factor and the like. In addition, measures for small voltage measurement and noise, also mentioned for measurement of the frequency domain. Applied electric electronic measurements, 1 ~ 2 times, For example, optical measurements. Confirmation of learning achievement, 1 time, Confirmation of learning achievements on electric and electronic measurements.					
[Course requirements]					
Electromagnetism, electrical and electronic circuits, mechanics					
[Evaluation methods and policy]					
The result of the final test, the results of tests at each lecture, and some reports will be taken into account for the total evaluation.

Days and periods	Fri.1	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese and English
[Overview and purpose of the course]					
We study properties of eigenfunctions, such as trigonometric functions, Bessel functions, Legendre functions as solutions of linear differential equations, which appear in various subjects of electric and electronic engineering such as electromagnetics, plasma physics, and quantum mechanics. As applications of these eigenfunctions, we also study Fourier series, Fourier transform, and Laplace transform.					
[Course objectives]					
We learn mathematical methods to describe spatial and temporal evolutions of various physical phenomena.					
[Course schedule and contents]					
<p>Classification of Partial Differential Equations,2times,Partial Differential Equations (PDE) : Laplace, Helmholtz, and diffusion equations; elliptic, hyperbolic, and parabolic types of 2nd order PDE.; derivation of Ordinary Differential Equations (ODE) from PDE by separation of variables</p> <p>Ordinary Differential Equations,2times,Series solutions by Frobenius' method; trigonometric, Bessel, and Legendre functions. Singular points for ODE; Wronskian; linear independence of solutions; second solution Sturm-Liouville Theory,1time,Self-ajoint ODE; Hermitian operator; Sturm-Liouville theory</p> <p>Green's Function Method,1time,Green's function method to solve nonhomogeneous equations.</p> <p>Bessel Functions,2times,MATLAB Demonstration (vibrating membrane, EM wave radiation), generating function, Bessel series; application to frequency modulation. Hankel functions; 3D Helmholtz equation in spherical coordinates, spherical Bessel functions</p> <p>Legendre Functions,1time,Legendre functions; generating functions; boundary value problems; associated Legendre polynomials.</p> <p>Fourier Series,1time,Properties of Fourier Series, Gibbs Phenomenon</p> <p>Fourier Transform,2times,Fourier integral, Fourier transforms of Gaussian and derivatives, Dirac delta function, Solutions of wave equation and diffusion equation</p> <p>Laplace Transform,2times,Laplace transform, inverse Laplace transform, initial value problems of ODE</p> <p>Confirmatin of Understanding,1time,The level of understanding on all topics covered by this lecture will be confirmed through by the term examination.</p>

Course number		U-ENG26 36103 LJ72			
Course title (and course title in English)	電気電子数学 2 Mathematics for Electrical and Electronic Engineering 2		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor, YOSHII KAZUYOSHI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Wed.3	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This course focuses on signal and function approximation, covering both theoretical foundations and engineering applications from two perspectives: linear algebra/functional analysis and statistical inference/machine learning. The transformation and approximation of measurement data are fundamental to engineering. In particular, the concepts of linear spaces and linear mappings form the foundation of various theories in electrical, electronic, and information engineering.					
[Course objectives]					
This course enables students to acquire fundamental knowledge applicable to various subjects such as signal processing, image processing, automatic control engineering, and communication theory, as well as a universal and unified perspective that applies across different research fields.					
[Course schedule and contents]					
Linear Spaces and Linear Mappings (2 sessions): Reviews linear algebra, explaining the concepts of linear spaces and linear mappings beyond mere matrix calculations. Introduces norms and inner products on linear spaces, describing their properties as metric linear spaces. Also explains data (vector) representation using bases and their relationship to eigenvalue problems. Function Spaces and Linear Operators (2 sessions): Explains infinite-dimensional vector spaces (function spaces) containing signals and functions as elements, extending from finite-dimensional vector spaces. Introduces representative function spaces and explains convergence, Cauchy sequences, and completeness. Also covers mappings (operators), projections, orthogonality, and orthogonalization in function spaces, along with function approximation problems using orthogonal systems and their completeness. Bases of Linear Spaces (3 sessions): Explains bases in linear spaces. Covers orthogonal bases, Gram-Schmidt orthogonalization, and their relationship to linear mappings. Explains Principal Component Analysis (PCA) as a method of constructing linear mappings using orthogonal bases from both function approximation and statistical inference perspectives. Also covers Independent Component Analysis (ICA) for constructing linear mappings using non-orthogonal bases. Bases of Function Spaces (2 sessions): Explains bases in function spaces. Covers function systems frequently used in signal processing, such as trigonometric and Haar function systems. Shows how Legendre, Laguerre, and Hermite polynomial systems					
----- Continue to 電気電子数学 2 (2)					

電気電子数学 2 (2)

are uniformly generated through function orthogonalization. Also explains spherical harmonics as orthogonal basis systems on spheres and introduces their engineering applications.

Signal Transformation (2 sessions):

Explains function expansion as a method of signal representation. Covers generalized Fourier series extending trigonometric systems and their convergence, explaining least-squares approximation of continuous periodic signals from both function approximation and statistical inference perspectives. Also derives Fourier transforms as limits of Fourier series and explains Fourier transforms of representative functions including delta functions, step functions, and Gaussian functions.

Signal Learning (3 sessions):

Explains learning of signal dynamics. Provides unified explanation of formulation, inference, and learning of Hidden Markov Models (HMM) and Linear Dynamical Systems (LDS) for discrete signals from maximum likelihood criterion perspective. LDS is also explained from control theory perspective. Covers applications to electrical and electronic engineering problems incorporating differential equations.

Learning Achievement Confirmation (1 session):

Dedicated to confirming learning achievement of the above content.

*Content and schedule may change depending on class progress and student understanding.

[Course requirements]

Linear algebra

[Evaluation methods and policy]

Final examination + report assignments

Course number		U-ENG26 46104 LJ72			
Course title (and course title in English)	電気伝導 Electrical Conduction in Condensed Matter		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor, YONEZAWA SHINGO Graduate School of Energy Science Professor, DOI TOSHIYA	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Wed.2	Class style	Lecture (Media-based course)	Language of instruction	Japanese
[Overview and purpose of the course]					
<p>A fundamental aspect of the electrical conduction in solids is discoursed in terms of physics based on the classical dynamics and later on the quantum physics. An important concept of the phonon and the electron-phonon is discoursed, which play a very important role in the electrical conduction in solids. The electrical conductivity is discoursed with a frequency from 0, that is dc, to optical frequency, by which a unified understanding of electrical conduction and the optical property is intended.</p>					
[Course objectives]					
<p>This class is intended to bestow the understanding of the solid state physics of a level dealt in the celebrated textbook by Ashcroft and Mermin. It is also intended for those attending in this class to acquire an ability sufficient to strive through such a textbook by himself or herself after the class is completed.</p>					
[Course schedule and contents]					
<p>(1) Fundamentals of quantum mechanics, and the hydrogen atom model (2 classes) A simple review is made of quantum mechanics, and explication is made of electron states (energy, spatial distribution, etc.) within hydrogen and atoms other than hydrogen.</p> <p>(2) Free-electron Fermi gas (3 classes) Explanation is made of the free-electron model as an ideal Fermi gas. Then, an overall explanation is provided of conductivity in metals, electronic specific heat, and the Hall effect.</p> <p>(3) Energy bands (2 classes) The band structure of electron energy within a solid crystal is introduced, and explanation is provided of conductivity and the band structures of conductors, semiconductors, and insulators.</p> <p>(4) Electron-phonon interactions, and conductivity in metals and semiconductors (4 classes) Lattice vibration is explained via quantized phonons (Bose particles) and Bose statistics, and lattice specific heat is introduced via determination of phonon density of state. Phonon scattering and electron scattering are explained. On this basis, explanation is then provided regarding the heat dependent nature of resistivity in metals, as well as of the Bloch-Gr#252neisen law at low temperature. Conductivity in semiconductors, especially scattering, is also explained.</p> <p>(5) Superconductivity (3 classes) With respect to superconductive phenomena, explanation is made, using the London equation, of the</p>					
Continue to 電気伝導(2)					

電気伝導(2)

Meissner effect, etc. Overview explanation is made of the Ginzburg-Landau theory, and order parameters are introduced. The relationship between phase and vector potential, important for superconductivity, is explained, as well as the Josephson effect. Explained also is magnetic flux quantization within type II (high field) superconductors.

(6) Feedback lesson (1 class)

Confirmation of learned content is made based on evaluations of short tests and the score on the final examination, etc.

[Course requirements]

Those who would like to attend in this class are recommended to study electrodynamics, statistical physics, and introduction to the solid state devices in advance. The lecture is, however, given in Japanese.

[Evaluation methods and policy]

Basically, an examination is imposed after the last class. A report may be imposed in case of necessity.

Days and periods	Mon.5	Class style	Lecture (Face-to-face course)		Language of instruction	Japanese	
[Overview and purpose of the course]							
This lecture will explain principles and concepts of electric machineries used in the fields of our living and industrial applications. Especially, detailed explanation will be made for variable speed control of the rotating machines and re-generation method. Recent trends for the developments of the electric machineries such as ones for the electric vehicle and the wind turbine are also to be outlined.							
[Course objectives]							
Understand fundamentals of designs, kinetic characteristics, coordinate transform as well as concept of variable speed control and drive-control method of rotating machineries. Also, understand basic concepts on recent trends of the developments.							
[Course schedule and contents]							
Concept of output power and fundamental aspects of design in electric machineries, 2-3 times, Discuss the relationship among output power, rotating speed, pole number, electric loading and magnetic loading in electric machineries. Also, concept of temporal rating and that of object oriented design are also to be explained. load characteristics and kinetic characteristics, 1-2 times, Discuss the load characteristics, kinetic characteristics, etc. of the rotating machineries are explained. Examples of visualized simulation results may also be shown for the aid of easier understanding. Principle of variable speed control of rotating machineries, 6-8 times, Based upon concrete examples, necessity for the variable speed control of the rotating machineries is discussed. And then, fundamental equations of respective rotating machines, method of coordinate transform for the expression of dynamic characteristics are explained. Further, basic concept and fundamental principle of the variable speed control is described. Power conversion for drive of rotating machines, 1-2 times, Power conversion method for the realization of variable speed control is explained. Permanent magnet rotating machines, 1 time, Permanent magnet rotating machine, which is one of the most major motors, is explained from the point of view of its rotating principle as well as characteristics. Trends of new electric machineries, 1 time, Trends of developments of new rotating machineries, e.g., electric (hybrid) automobile, linear motor, wind turbine, etc., are outlined. Also, concept and meaning of re-generation is explained. Summary, 1 time, The classes are summarized. This is the feedback to students according to their score.

Course number		U-ENG26 36109 LJ72			
Course title (and course title in English)	電波工学 Radio Engineering		Instructor's name, job title, and department of affiliation	Research Institute for Sustainable Humanosphere Professor,SHINOHARA NAOKI Research Institute for Sustainable Humanosphere Professor,HASHIGUCHI HIROYUKI	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Mon.3	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
In this class we study basics of the radio wave and antennas. We first examine the nature of the electromagnetic wave based on the wave equation derived from the Maxwell's equations. We discuss the relation between the source current distribution and the radiated wave field in terms of various antenna parameters. We further study the wave propagation, such as refraction, reflection, scattering, and diffraction. We also derive the basics of guided wave transmission from the boundary conditions of the Maxwell's equations.					
[Course objectives]					
Understand the basic theory of the radio wave, and technology for its industrial applications.					
[Course schedule and contents]					
<p>Nature of the radio wave,2-3times,We solve the Maxwell's equation in its simplest form to show that it gives the electromagnetic wave propagating in space. Basic nature of planar wave is examined including its reflection, transmission, velocity and polarization.</p> <p>Radiation and basics of antennas,4-5times,We derive the radiation field from the Maxwell's equation with sources, and study its characteristics in the near and far fields. We examine the radiation from short dipole and linear antennas in terms of important parameters such as the gain, impedance, frequency characteristics, and effective area. We also study principle, structure, and basic analysis methods of various realistic antennas such as array and aperture antennas.</p> <p>Radio wave propagation,2-3times,We study basic issues related to various types of the radio wave propagation including the ground wave, tropospheric and ionospheric propagation, and space communication. We also discuss diffraction and scattering of the radio waves.</p> <p>Guided wave transmission,4-5times,We first study basic ideas related to the guided wave transmission, such as the transmission line theory and the Smith chart. We then study individual elements including coaxial line, microstrip line, rectangular waveguide, and circular waveguide, mainly focusing on their propagation modes, transmission characteristics, and loss.</p> <p>The order of instruction for each topic and subtopic may vary, and the course instructors will organize the lectures as appropriate for the students. Students will be informed of the lecture plan (for all 15 lectures) in advance and will have sufficient time for preparation.</p>

Course title (and course title in English)	アンテナ・伝搬工学 Antenna and Propagation Engineering		Instructor's name, job title, and department of affiliation	Research Institute for Sustainable Humanosphere Professor, YAMAMOTO MAMORU Research Institute for Sustainable Humanosphere Professor, HASHIGUCHI HIROYUKI	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Thu.2	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
In this course, students learn about various types of electromagnetic field analysis techniques and antenna pattern synthesis theory used in characteristic analysis and design of antenna. Then, an overview of radio application technologies (radio-wave propagation, different types of radar, etc.) is presented, as well as a look at the current situation regarding these technologies.					
[Course objectives]					
Based on a knowledge of radio engineering, students will gain a higher level of understanding of electromagnetic-wave concepts and of specific technologies in which electromagnetic waves are used.					
[Course schedule and contents]					
<p>Pattern synthesis for array antenna (2-3 classes)</p> <p>Students learn the fundamentals of optimal pattern synthesis theory used to improve array antenna gain and to suppress sidelobes. Taken up especially are Dolph-Thebysheff and Taylor methods. Students also learn about adaptive array technology.</p> <p>Fundamentals of electromagnetic field analysis (3-4 classes)</p> <p>Explained are the principles and characteristics of various methods used to determine electromagnetic fields radiating from antennas and dynamic impedance, including the finite element method (FEM), electromotive force method, method of moments, physical optics method, finite-difference time-domain (FDTD) method, etc.</p> <p>Radio wave propagation (2-3 classes)</p> <p>Explained are fading in wireless communications, propagation in outer space communications, remote sensing applications, etc.</p> <p>Radar technology (2-3 classes)</p> <p>Explanation is made of principles of measuring distance and speed using radar, and of element technologies including pulse compression method, etc. Discussion also covers the principles and signal processing methods of example applications of radar technologies, including meteorological radar, atmospheric radar, and synthetic aperture radar.</p> <p>Radio navigation (1-2 classes)</p> <p>Explanation is made of the principles of technologies for measuring the positions/locations of ships and aircraft, etc., by using radio waves. Discussion also covers an overview and applications of radio navigation</p>

methods, as represented by the global positioning system (GPS).

Confirmation of extent of student learning (1 class)

Confirmation (evaluation) is made of the extent that students have learned the contents of this course.

[Course requirements]

Students are required to be taking or to have taken a course in radio engineering.

[Evaluation methods and policy]

Grading method

Scores on regular tests (80%) Student performance in classes (20%)

Grading standards

The following grades are given in accordance with the goal-achievement levels of each individual student:

A+: Course goals have been accomplished at an extremely high level, from all perspectives.

A: Course goals have been accomplished at a high level, from all perspectives.

B: Course goals have been accomplished, from all perspectives.

C: Confirmation can be made, from a majority of perspectives, of effects of student learning, and course goals have been accomplished to a certain extent.

D: While course goals have been accomplished to a certain extent, further effort by the student is desirable.

F: No confirmation can be made of effects of student learning, and it is difficult to say that a student has accomplished the goals of this class.

[Overview and purpose of the course]					
This lecture covers basics of embedded systems. Processor architectures, memory subsystems, I/O systems, and overall system architectures in embedded systems will be explained.					
[Course objectives]					
To understand basic structures of embedded computer systems. To understand impacts of architectural design choices on performance and energy consumption of embedded systems.					
[Course schedule and contents]					
<p>Basic properties of computer systems (1 week): History of embedded computer systems.</p> <p>Cache memory (3 weeks): Cache architectures, data transfer between main memory and cache.</p> <p>Compiler optimization (1 week): A role of compilers in computer systems and performance tuning by code optimization.</p> <p>Main memory virtualization (2 weeks): Effective use of main memory and secondary memory, memory virtualization, and address conversion.</p> <p>Operating system and interrupt (2 weeks): The concept of interrupt, interrupt handling, and necessary hardware supports for the interrupt will be explained. Relation between operating systems and the interrupt, and time overhead for the interrupt will be explained.</p> <p>Instruction pipeline (2 weeks): The concept of instruction pipelining, necessary mechanisms for the pipelining, and characteristics of RISC processors.</p> <p>Instruction formats and addressing modes (2 weeks): Formats and addressing modes of typical instructions.</p> <p>Trends in embedded systems (1 week): Recent trends on embedded computer architectures such as multi-core processors.</p> <p>Review (1 week): The review of understanding on this lecture.</p>					
[Course requirements]					
logic circuits (60120), computer architecture basics (60160)					
[Evaluation methods and policy]					
The level of achievement toward the goal of this lecture will be examined by the end-of-term exam.					
[Textbooks]					
The course will loosely follow "Computer Organization and Design: The Hardware/Software Interface" by patterson and hennessy. Having an access to a copy is strongly recommended.

Days and periods	Thu.4	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This lecture explains design methodologies for CMOS LSI circuits. Both analog and digital circuits will be covered.					
[Course objectives]					
From this lecture, you can understand design flow of CMOS LSI circuits.					
[Course schedule and contents]					
Following topics will be covered. By assessing the understanding of the students and adding explanations and tasks when necessary, we will spend the number of weeks listed in [].					
(1) CMOS process and devices [2 weeks] Overview of CMOS process technology related to LSI circuit design will be explained. Structures, characteristics and modeling methods for MOS transistors, capacitors, inductors and interconnects will be also explained.					
(2) Analog circuit design [2 weeks] Architecture and behavior of basic analog circuits such as constant current source and current mirror amplifier will be explained. Design methods for op-amps will be explained.					
(3) Digital circuit design [4 weeks] Design methodologies for combinational and sequential circuits are explained. Hardware algorithms for arithmetic logic unit will be discussed.					
(4) Evaluation and optimization of digital circuits [2 weeks] Methodologies for evaluating and optimizing the power consumption and delay of circuits are explained. Test methods will be also explained.					
(5) Full custom layout design [2 weeks] Design rules and layout verification methods will be explained. Full-custom layout design methods for analog circuits and basic logic gates are explained. Design methodologies for ROM and RAM will be explained.					
(6) Chip level layout design [2 weeks] Layout design methods and chip-level assembly methods in a cell-based design flow will be explained.					

Continue to 集積回路工学(2)					

集積回路工学(2)

(7) Confirmation of understanding [1 week]

The level of understanding will be confirmed. Feedback will be given if necessary.

[Course requirements]

Logic circuits, Computer engineering, Digital circuits, Embedded computer system

[Evaluation methods and policy]

The level of achievement toward the goal of this lecture will be examined by the results of reports. All reports are mandatory.

[Textbooks]

Hand-outs will be provided.

Course title (and course title in English)	メカトロニクス入門 Introduction of Mechatronics		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor, KOH HOSODA Graduate School of Engineering Senior Lecturer, Kawasetsu Takumi	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Wed.4	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
<p>Study of the basics of mechatronics, a multidisciplinary technology field comprised of mechanical and electronic aspects. The lectures will describe the history and concepts that make up the field of mechatronics and explain the individual technologies and applications of mechatronics.</p> <p>The individual technologies comprising mechatronics include sensor/actuator/computer interfaces, actuator control methods, and their mechanisms. In addition, we will discuss robot manipulators as an application of mechatronics and explain concepts related to kinematics and dynamics.</p>					
[Course objectives]					
<p>The objective of this course is to cultivate an understanding of the basic concepts of mechatronics, a multidisciplinary field combining the principles of mechanical and electronic engineering. The course will pursue the following six objectives:</p> <ol style="list-style-type: none"> 1. Understanding the history and development of the field of mechatronics. 2. Understanding the configuration of mechatronic systems. 3. Understanding and acquiring modes of thinking about mechatronic systems through the study of examples. 4. Study of the existing sensor and actuator systems and making selections. 5. Understanding computer control and the configuration of electronic machines that perform complex operations in different situations. 6. Understanding the basics of kinematics and dynamics of robotics as an application of mechatronic principles. 					
[Course schedule and contents]					
<p>Mechatronics, 3 sessions These sessions will explain the definition and history of mechatronics, and provide an overview of the basic configurational characteristics utilized in the field of mechatronics.</p> <p>Mechatronic components, 6 sessions</p>					
Continue to メカトロニクス入門(2)					

メカトロニクス入門(2)

These sessions will describe the interfaces between sensors, actuators, and computer components that make up mechatronic systems.

Mechanisms and controls, 3 sessions

These sessions will discuss the types of mechanical motion and their mechanisms in addition to the basic aspects of actuator control used in robotic systems.

Basics of robotics, 2 sessions

These sessions will discuss robot manipulators and provide an overview of the kinematics and dynamics concepts.

Confirmation of learning achievement, 1 session

Achievement of learning will be evaluated through a written test.

Course feedback, 1 session

[Course requirements]

N/A

[Evaluation methods and policy]

Students will be evaluated primarily through tests, but points may also be earned from regular course assignments.

[Textbooks]

Course number		U-ENG26 36117 LJ72					
Course title (and course title in English)	真空電子工学 Vacuum Electronic Engineering			Instructor's name, job title, and department of affiliation		Graduate School of Engineering Associate Professor, GOTOU YASUHIITO	
Target year	3rd year students or above	Number of credits		2	Year/semesters	2025/First semester	
Days and periods	Thu.1	Class style	Lecture (Face-to-face course)		Language of instruction	Japanese	
[Overview and purpose of the course]							
Vacuum Electronic Engineering deals with the devices that exhibit some functions by controlling the motion of the electrons (or charged particles) with electromagnetic fields. High power and high frequency vacuum tubes and ion implantation systems that are used for impurity introduction to semiconductors are based on the theory of vacuum electronic engineering. This course explains fundamentals of the electron motion in vacuum and fundamentals on the control of electron beams are given; extraction of electrons from solid to vacuum, electron optics, and electron devices.							
[Course objectives]							
To understand the methods to extract electrons from solids, methods to control the electrons by electromagnetic fields, and operational principle of the vacuum devices.							
[Course schedule and contents]							
<p>[Introduction to Vacuum Electronic Engineering] Once Application field of the vacuum electronic engineering will be shown.</p> <p>[Extraction of electrons from solid to vacuum] 4 times The mechanism of thermionic and field emission, which are mostly used to extract electrons in solids to vacuum, will be described in detail. The formula of the extractable current density for each mechanism will be presented, explaining the effects of image force and space charges.</p> <p>[Motion of electrons in electromagnetic fields and its control] 5 times The electron trajectories in electrostatic, magnetostatic, and orthogonal electromagnetic fields will be described. Lens effects of the electrostatic and magnetostatic fields will also be described, and concrete idea for application of these effects to practical devices will be presented.</p> <p>[Electron beam devices] 4 times Operational principle of the electron devices based on electron beams, namely vacuum tubes, will be described. Especially, principles of a velocity modulation tube will be presented, showing the advantage of vacuum electron devices for high power and high frequency application.</p> <p>[Feedback] Once Summarizing the above contents, degree of understanding will be evaluated.</p>							
<div style="text-align: right;">Continue to 真空電子工学(2)</div>							

真空電子工学(2)

[Course requirements]

Fundamental knowledge on electromagnetic theory, dynamics, electrons in solids, and electric and electronic circuits is necessary.

[Evaluation methods and policy]

[Evaluation method]

Evaluation will be based on one written examination.

[Evaluation policy]

The result of the written examination should be 60 and above out of 100.

60 and above: Passed

59 and below: Failed

[Textbooks]

Zyunzo Ishikawa 『Science and Technology of Charged Particle Beams』 (Corona) ISBN:978-4-339-00734-3

[References, etc.]

(Reference books)

Tetsuro Tanaka 『Fundamentals of Material Science and Engineering』 (Asakura) ISBN:978-4-254-21003-3

[Study outside of class (preparation and review)]

Necessary preparation will be shown at the end of previous lecture.

[Extraction of electrons from solid to vacuum]

(In preparation) Review the band structure, density of states of electrons in solids, etc. that you learned at "Fundamentals of Electron Physics and Devices" in the 2nd grade. Review the Poisson's equation, image charge method, etc. that you learned at "Electromagnetic Theory 1" in the 2nd grade.

[Control of motion of electrons in electromagnetic fields]

(In preparation) Review the equations of motion of charged particles in electromagnetic fields that you are learning at "Electromagnetic Theory 2" in the 3rd grade.

[Electron beam devices]

(In preparation) Review the operating principle of semiconductor transistors and their equivalent circuits that you learned at "Electronic Circuits" in the 2nd grade.

Continue to 真空電子工学(3)

真空電子工学(3)

(Other information (office hours, etc.))

Bring your calculator, for the exercise that will be made in the class.

Course number		U-ENG26 26118 SJ72			
Course title (and course title in English)	電気電子回路演習 Exercise of Electric and Electronic Circuits		Instructor's name, job title, and department of affiliation	Research Institute for Sustainable Humansphere Professor,KOJIMA HIROTSUGU Graduate School of Energy Science Professor,SHIMODA HIROSHI Institute of Advanced Energy Professor,INAGAKI SHIGERU Graduate School of Energy Science Assistant Professor,UEDA KIMI Graduate School of Informatics Assistant Professor,SHIRAKI RYUTA Research Institute for Sustainable Humansphere Associate Professor,MITANI TOMOHIKO	
Target year	2nd year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Thu.3,4	Class style	Seminar (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Students will gain an understanding of phenomena that will serve as linkages between calculus and linear algebra, etc., learned during their first university year, and theories of electrical and electronic circuits. Students will also learn the basic concepts and ways of thinking employed in the field of electrical and electronic engineering. Also, in their personal environments, students will be able to learn about, via trial-and-error freely and at their own initiative numerical calculation, circuit simulation, and circuit testing. In their group, students will select a theme they find interesting, and via discussions using poster presentations, etc., students will deepen their mutual understanding and have the opportunity to be exposed to a variety of different opinions.					
[Course objectives]					
Via circuit theory, numerical calculation, circuit simulation, and circuit testing, students will boost their understanding of electrical and electronic circuits via linkages between a variety of viewpoints. The aim is for each student to establish a base on which to build their own subjective ideas and areas of interest within the broad field of electrical and electronic engineering.					
[Course schedule and contents]					
<p>Overview explanation (1 class) An overview of this seminar is presented, covering the topics of evaluations, goals, and progress methods. The seminar environment will be established during this first class.</p> <p>Time-domain analysis (3 classes) With respect to differential equations of circuits, via analysis using circuit simulators, phase plane analysis using linear algebra, and simple circuit experimentation, students will learn how to “decompose” phenomena into those of low-dimensional systems, so as to gain a better understanding.</p> <p>Frequency-domain analysis (2 classes) Students will learn about alternating-current (AC) circuit theory via linkages with time domain analysis.</p>					
Continue to 電気電子回路演習(2)					

電気電子回路演習(2)

2-port circuits (2 classes)

For circuits having input and output, students will learn about frequency characteristics from the viewpoint of pole-zero structure.

Group discussion (1 class)

To deepen student understanding of course contents, investigation will be made regarding the contents of poster presentations.

Active circuits (3 classes)

Students will understand the concept of bias and deepen their understanding of circuit simulators and testing using amplification, switches, and feedback.

Presentations (3 classes)

Via their preparations for poster presentations, as well as their actual presentations, students will deepen their understanding of course content; this will also provide an opportunity to confirm the extent of learning of each student.

[Course requirements]

Prerequisites for this course are courses in fundamental theory of electrical circuits and in electrical and electronic circuits.

[Evaluation methods and policy]

Since this is an exercise subject, attending a class and working on an assignment is an essential requirement. Then, the achievement of the understanding of electrical and electronic circuits is evaluated by submitted reports. In addition, the attitude of the experimental room and active improvement measures are also evaluated.

Regarding the specific evaluation method, grades are calculated for each of active participation in the exercise, pre-assignment, development assignment, and submitted report by the deduction method from 100 points.

北野正雄 『電子回路の基礎』（レイメイ社）

[Study outside of class (preparation and review)]

As preparation for each seminar class, assigned exercises are to be performed and submitted to Panda. For review, students should perform work on advanced problems at home.

Continue to 電気電子回路演習(3)

電気電子回路演習(3)

(Other information (office hours, etc.))

For exercises, assigned machines (notebook PC, breadboard, etc.) shall be brought to the classroom. Prior to starting their seminar, students are to attend a guidance meeting for an explanation of the overall course. Students who borrow portable calculation devices to perform experiments should manage these devices appropriately. Office hours are in the Professor ' s Lounge (S101) during second period on Thursdays. Students who do not understand pre-class assignments should definitely come during office hours and attend the seminar class only after their problems have been resolved.

*Please visit KULASIS to find out about office hours.

Target year	2nd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Thu.1,2,3,4	Class style	Experiment (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Via actual test measurements of the characteristics of electronic elements using basic measurement devices employed in electrical and electronic engineering fields, students will acquire the skills required for using these devices. Tests will also be performed to conduct initial step investigation of the mechanisms of electronic and electrical circuits and elements, and to deepen students' understanding of electrical and electronic engineering fields.					
[Course objectives]					
The goals of this course are for students to acquire initial-stage testing techniques used within the electrical and electronic engineering fields, and to understand electrical and electronic circuits. The aim is to have students achieve these goals chiefly via the creation of electrical and electronic circuits, and via measurement					
----- Continue to 電気電子工学基礎実験(2) -----					

電気電子工学基礎実験(2)

tests of the characteristics of these circuits.

[Course schedule and contents]

Fundamentals of experiments in electrical and electronic engineering (lectures and experiments) (3 classes)
Discussion is made of aspects necessary in the performance of electronic/electrical engineering experiments, namely, the securing of a safe environment, the proper way to take experimental notes, how to draw graphs, and how to write related reports. Students will learn how to use an oscilloscope, which will give them a foundation in measurement technologies. Students will also have the opportunity to edit reports created by others, an activity designed to give them even keener insights in report writing.

Passive elements (experiments) (2 classes)

Frequency characteristics measurements (amplification, phase, etc.) are performed for circuits made from passive elements such as coils, capacitors, resistors, etc.

Active elements and amplifier circuits (experiments) (6 classes)

In these classes, characteristics measurements are performed for circuits made from diodes, bipolar transistors, and operational amplifiers. Through these experiments, students will gain an understanding of the operations of amplifier circuits, etc.

Logic circuits (experiments) (2 classes)

Students design and make combination circuits and sequential circuits to understand their operations.

Confirmation of extent of student learning (2 classes)

Students will be asked questions regarding experiment methods, contents/details, and report writing. This will help to deepen student understanding of experimentation details and will also enable confirmation of the extent of student learning in this course.

[Course requirements]

Prerequisites for this course are "Fundamentals of Circuit Theory" and "Electric and Electronic Circuits."

[Evaluation methods and policy]

From the contents of experiment reports, evaluations can be made with respect to the extent of student learning of experimental techniques, as well as regarding the level of their understanding of electrical and electronic circuits. Each student's attitudes and engagements will also be evaluated in the experimental laboratory, and with respect to how proactive students are in striving for improvement. In other words, attendance at experiments is mandatory!

[Overview and purpose of the course]					
In this course, students acquire fundamental knowledge and practical skills, via basic experiments and discussions, regarding electrical machines, semiconductor properties and devices, electromagnetic waves, computers, and communications.					
[Course objectives]					
The goals of this class are for students to gain an understanding of fundamental items, including the principles and characteristics of various electrical equipment, semiconductor characteristics and device characteristics, electromagnetic wave propagation and interference, computer hardware and software, characteristics of communication methods, etc.					
[Course schedule and contents]					
Overview of practical of electrical and electronic engineering (1 class) Explanation is made of fundamental items and points of special precaution for experiments in electrical and electronic engineering, and students are educated in safety issues related to experiments.					

Continue to 電気電子工学実験(2)					

電気電子工学実験(2)

Electrical equipment and devices (2 classes)

Students perform measurement of the basic characteristics of transformers, induction machines, direct current (DC) machines, and synchronous machines. Students will gain an understanding of the characteristics of generators and electric motors, and they will also study three-phase alternating current.

Semiconductor characteristics and devices (4 classes)

Students will measure band gap, light absorption, and other characteristics of semiconductors; measurement is also made of the characteristics of diodes and field-effect transistors, basic devices that use semiconductors. In this way, students gain an understanding of their operations and of the physics that serve as the background for such devices.

Fundamentals of electromagnetic waves (2 classes)

Experiments are performed on the propagation of electromagnetic waves in dual conductor lines and in free space, enabling students to gain knowledge of the characteristics and measurement methods of electromagnetic waves.

Microcomputers (2 classes)

Using microcomputers, students will gain an understanding the structure (composition) and functions of computers, as well as an understanding of the relationships between hardware and software within a computing system.

Communications fundamentals (2 classes)

Measurement is made of time signals and frequency spectra, the basic modulation method used in communications. Students will understand the characteristics of various modulation methods, as well as the effects of sampling.

Confirmation of extent of student learning (2 classes)

Discussion is made regarding experiment methods and contents, enabling students to deepen their understanding of experiment details and giving them a greater ability to explain the like. Additionally, confirmation is made of the extent of student learning.

[Course requirements]

Prerequisites for this course are student acquisition of fundamental knowledge of electrical circuits, electronic circuits, and electromagnetism. Students must also have completed a course in fundamental practice of electrical & electronic engineering.

[Evaluation methods and policy]

From the contents of experiment reports, evaluations can be made with respect to the extent of student learning of experimental techniques, as well as regarding the level of their understanding of electrical and electronic circuits. Evaluation will also be made of each student's attitudes and engagement in the experimental laboratory. Therefore, attendance at experiments is mandatory!

Course number		U-ENG26 36203 LJ72			
Course title (and course title in English)	電力システム工学 Power System Engineering		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor,SUSUKI YOSHIHIKO	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Mon.1	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
<p>The electric power system is a large-scale networked system that transports electric energy and supports our daily lives. Power systems engineering is a field of study that deals with the science of analysis, control, operation, and planning of power systems, by integrating mathematical, electrical and electronic systems, information, and economic disciplines. In this lecture, we will discuss the fundamentals of large-scale power systems. This lecture aims to describe the fundamentals of large-scale power systems, including system characteristics and components, circuit analysis, modeling, stability, control methods, etc.</p>					
[Course objectives]					
<ul style="list-style-type: none"> - To explain the basic structure and elements of large-scale power systems; - To explain the fundamentals of analysis, control, and operation of electric power systems based on the content of previous studies of mathematics (linear algebra, differential equations), circuits, electrical equipment, and system control; - To have an opinion about the relationship between electrical and electronic engineering and society from the viewpoint of electrical energy. 					
[Course schedule and contents]					
<p>Introduction (0.5): Basic features of large-scale power systems (two types of transmission, configuration, etc.), the current status and future trends in power systems, etc. are reviewed to clarify the outline, approach, and objectives of this lecture.</p> <p>Three-phase circuits and unit method (2.5): Voltage, current, power, and equivalent circuits of three-phase circuits are reviewed, which are the basis of power system analysis. The per-unit system including three-phase transformers will be also reviewed.</p> <p>Steady-state characteristics (2): Modeling and analysis for the analysis and operation of steady-state characteristics of power systems will be explained. Specifically, the derivation of power flow equations and their calculations will be covered.</p> <p>Dynamic characteristics (5):</p>					
----- Continue to 電力システム工学(2) -----					

電力システム工学(2)

Modeling and analysis for the analysis and control of dynamic characteristics of power systems, especially stability, will be explained. Specifically, the course will start from the derivation of the dynamic equations and overview the phenomena that occur, classifying them into synchronization, frequency, and voltage, as well as the mathematical treatment of the mechanisms of loss of stability.

Control and operation (3):

The control methods to maintain the frequency of the power system at 60 Hz or 50 Hz are studied after discussing the relationship between the frequency and the effective power in the system. Next, the relationship between voltage and reactive power in the system will be discussed, and various methods will be studied for maintaining the voltage from 500kV to 100V in the power system. In addition, the economic operation of power systems will be studied from the standpoint of optimization applications.

Distributed power sources (1):

From the standpoint of power electronics applications, students learn how to connect and operate small-scale distributed power sources such as cogeneration, renewable energy, and storage batteries in a system, which is different from conventional large-scale plants.

Summary with feedback (1)

[Course requirements]

Circuit Theory (60630, 60030, 60220); Electric Machinery Fundamentals (61050); Electric Power Engineering 1 (61070)

[Evaluation methods and policy]

Final examination and homework.

[Textbooks]

Not used

[References, etc.]

(Reference books)

Introduced during class

[Study outside of class (preparation and review)]

Students should review the contents of phasors and AC power in basic electric circuits, three-phase circuits in electric and electronic circuits, and synchronous machines in basic electric equipment and electrical and electronic engineering experiments.

Course number	U-ENG26 46204 LJ72				
Course title (and course title in English)	応用電力工学 Applied Electric Power Engineering		Instructor's name, job title, and department of affiliation	Graduate School of Engineering Professor, MATSUO TETSUJI Graduate School of Energy Science Associate Professor, TAKAI SHIGEOMI Part-time Lecturer, SAITOU YASUMITU	
Target year	4th year students or above	Number of credits	2	Year/semesters	2025/First semester
Days and periods	Mon.3	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
This course provides an introduction to power generation technologies for students of electrical and electronic engineering. This is the first course in power and energy engineering in the School of Electrical and Electronic Engineering. Topics include fundamentals of hydraulic, thermal, and nuclear power plants, fundamentals and current trends of renewable energy resources, and batteries.					
[Course objectives]					
The goal of this course is to understand fundamentals of power generation technologies.					
[Course schedule and contents]					
<p>"1. Introduction (1 class)</p> <p>Provide an overview of present conditions, future trends, etc. with respect to energy supply, including electric power, and describe the outline of the course and its goals.</p> <p>2. Thermal power generation (3 classes)</p> <p>After reviewing the basics of thermodynamics, explain the types of thermal power stations, including combined cycle power generation, as well as the components and operating principles of thermal power generation plants.</p> <p>3. Hydroelectric power generation (2 classes)</p> <p>After discussing the basics of hydraulics, explain the structures and characteristics of public works such as the dams, waterways, surge tanks, pipelines, etc. that make up hydroelectric power stations, as well as hydraulic turbines and hydraulic turbine generators.</p> <p>4. Nuclear power generation (3 classes)</p> <p>After reviewing the basics of atomic physics, explain basic information on nuclear fission, which is the core of nuclear power generation, and the operation of nuclear reactors, as well as the types of nuclear power stations and nuclear fuel.</p> <p>5. Electrical generation methods using renewable energy (2 classes)</p>					
Continue to 応用電力工学(2)					

応用電力工学(2)

As well as explaining electrical generation and environmental problems, explain methods of generating electricity that use renewable energy, i.e., alternative energy sources such as solar power and wind power.

5. Electrical generation by battery (2 classes)

Explain the principles of the conversion of chemical energy to electrical energy, fuel cells, rechargeable lithium batteries, and so on.

6. Summary (feedback class)

As well as summarizing the electrical generation methods we have studied, confirm the degree of learning attainment."

[Course requirements]

Basic circuit theory; Fundamental physics and chemistry

[Evaluation methods and policy]

Final examination or homeworks in the term.

[Textbooks]

Handouts.

[References, etc.]

(Reference books)

[Study outside of class (preparation and review)]

Students are advised to review class material using documents, etc.

A course with practical content delivered by instructors with practical work experience

(2) Details of instructors ' practical work experience related to the course

(3) Details of practical classes delivered based on instructors ' practical work experience

Course number	U-ENG26 36205 LJ72				
Course title (and course title in English)	機械学習 Machine Learning		Instructor's name, job title, and department of affiliation	Graduate School of Informatics Professor,ISHII SHIN Graduate School of Informatics Professor,NISHINO KO	
Target year	3rd year students or above	Number of credits	2	Year/semesters	2025/Second semester
Days and periods	Thu.3	Class style	Lecture (Face-to-face course)	Language of instruction	Japanese
[Overview and purpose of the course]					
Teaching sessions aim to help students learn the basics and applications of machine learning. Students are taught theoretical foundations and applications of statistical machine learning methods (in particular, supervised learning, unsupervised learning, and reinforcement learning), which are inductive approaches to solving complex problems.					
[Course objectives]					
To acquire knowledge about the basics of machine learning and to deepen one's understanding to a practical level by writing reports that involve programming.					
[Course schedule and contents]					
<ul style="list-style-type: none"> • Introduction to statistical machine learning (1 session): Explanations are given on the basic concepts of supervised and unsupervised learning with regards to machine learning based on statistical probability theory. (Professor: Ko Nishino) • Supervised learning (6 sessions): In relation to supervised learning, students are taught about linear regression involving the least squares method (1 session), and are given an explanation about linear discrimination involving support vector machines (1 session). Following this, students are taught to solve non-linear optimization problems with gradient methods using perceptrons as a subject (1 session), as well as multi-layer perceptrons and the backpropagation learning method used for them (1 session), deep networks centered on convolutional networks (1 session), and progression towards time series represented by LSTM (1 session). (Professor: Ko Nishino) • Unsupervised learning and statistical inference (4 sessions): In terms of unsupervised learning, students are taught basic ideas based on the statistical inference performed via probabilistic models (1 session), graphical models and the inference of the maximum likelihood (1 session), Bayesian inference (1 session), and the applications of image processing, etc (1 session). (Professor: Shin Ishii) • Reinforcement learning and exploration (3 sessions): With regards to reinforcement learning, which is an autonomous form of control learning based on rewards, students are taught about derivation from dynamic programming (1 session), formulation via probability approximation methods (1 session), and deep reinforcement learning, which has been applied more in recent years (1 session). If there is time, students are also taught the bandit problem (exploration problem). (Professor: Shin Ishii) • Application of machine learning in artificial intelligence (1 session): Students are informed about the latest situation regarding the application of machine learning in artificial intelligence. (Professors: Ko Nishino, Shin Ishii) 					
Continue to 機械学習(2)					

機械学習(2)

[Course requirements]

Students are required to have knowledge of computer software (60370).

[Evaluation methods and policy]

[Evaluation method]

Marks from exercises in teaching sessions and reports involving programming (80%); evaluation of performance in teaching sessions (20%)

Performance in teaching sessions is evaluated based on participation and remarks made in teaching sessions.

[Evaluation policy]

Achievement targets are evaluated according to the grade evaluation policy of the Faculty of Engineering.

[Textbooks]

Others; printouts are used.

[Overview and purpose of the course]					
We learn basic theories of graphs and their applications, and fundamental algorithms for solving graph problems.					
[Course objectives]					
The goal of this course is to learn basic theories of graphs and their applications, and fundamental algorithms for solving graph problems.					
[Course schedule and contents]					
1. Foundations of Graphs and (4 timeslots) I explain definition of graphs and basic properties of graphs. I also briefly review the basics of algorithms and their complexity. 2. Minimum spanning trees (1 timeslot) Kruskal's algorithm, Prim's algorithm, Steiner tree problem. 3. Shortest path problems (1 timeslot) Dijkstra's algorithm. 4. Euler circuits and Hamiltonian cycles (2 timeslots) Euler circuits, Hamiltonian cycles, Dirac's theorem. Ore's theorem. 5. Graph coloring (2 timeslots) Vertex coloring and edge coloring. Brooks's theorem, Vizing's theorem, Konig's theorem. Coloring maps. 6. Maximum flow problems (2 timeslots) Ford-Fulkerson's algorithm. 7. Matching (2 timeslots) Matchings, in particular, bipartite matchings. Hall's theorem, Hungarian method. 8. Exam (1 timeslot)
