## Global Engineering

|                                                                  |    |
|------------------------------------------------------------------|----|
| 230100 Exercises in Information Processing Basics                | 1  |
| 30010 Introduction to Global Engineering                         | 2  |
| 30040 Computer Programming in Global Engineering                 | 3  |
| 22010 Information Processing Basics                              | 4  |
| 35010 Introduction to Global Engineering                         | 5  |
| 35020 Exercises in Infrastructure Design                         | 6  |
| 23050 Exercises in Information Processing Basics                 | 7  |
| 22050 Information Processing Basics                              | 8  |
| 35030 Computer Programming in Global Engineering                 | 9  |
| 30100 Fundamental Mechanics                                      | 10 |
| 31330 Resources and Energy                                       | 11 |
| 30030 Probabilistic and Statistical Analysis and Exercises       | 12 |
| 30140 Environmental Health                                       | 13 |
| 31810 Introduction to Civil Engineering I                        | 14 |
| 30050 Mathematics for Global Engineering                         | 15 |
| 31340 Systems Analysis and Exercises for Planning and Management | 16 |
| 31620 Soil Mechanics I and Exercises                             | 17 |
| 30130 Hydraulics and Exercises                                   | 18 |
| 20510 Engineering Mathematics B1                                 | 19 |
| 30080 Structural Mechanics I and Exercises                       | 20 |
| 31320 Fundamental Environmental Engineering I                    | 21 |
| 31350 Geophysical Prospecting                                    | 22 |
| 31110 Dynamics of Soil and Structures                            | 23 |
| 31400 Atmospheric and Global Environmental Engineering           | 24 |
| 32000 Fundamental Theory of Elasticity and Stress Analysis       | 25 |
| 30240 Construction Materials                                     | 26 |
| 30530 Water Quality                                              | 27 |
| 31650 Fluid Mechanics                                            | 28 |
| 31410 Environmental Engineering, Laboratory I                    | 29 |
| 31640 Structural Mechanics II and Exercises                      | 30 |
| 31390 Fundamental Environmental Engineering II                   | 31 |
| 31360 Hydraulics and Hydrodynamics                               | 32 |
| 30570 Radiological Health Engineering                            | 33 |
| 31170 Continuum Mechanics                                        | 34 |
| 31080 Engineering Geology and Exercises                          | 35 |
| 31370 Coastal Environmental Engineering                          | 36 |
| 30300 Fundamentals of Hydrology                                  | 37 |
| 31070 Soil Mechanics II and Exercises                            | 38 |
| 30590 Environmental Plant Engineering                            | 39 |

|                                                                                              |    |
|----------------------------------------------------------------------------------------------|----|
| 31380 Experiments on Soil Mechanics and Exercises                                            | 40 |
| 31660 Physical Chemistry                                                                     | 41 |
| 30440 Planning and Management of Social Systems                                              | 42 |
| 31730 Engineering Mathematics B2                                                             | 43 |
| 31740 Engineering Mathematics B2                                                             | 44 |
| 30870 Experiments on Hydraulics                                                              | 45 |
| 32200 Experimental Basics in Earth Resources and Energy Science, Laboratory.                 | 46 |
| 30850 Public Economics                                                                       | 47 |
| 30400 Surveying and Field Practice                                                           | 48 |
| 30550 Sewerage System Engineering                                                            | 49 |
| 32100 Numerical Methods for Engineering and Exercises                                        | 50 |
| 31630 Urban and Landscape Design                                                             | 51 |
| 30540 Water Supply Engineering                                                               | 52 |
| 31530 Transport Policy                                                                       | 53 |
| 31440 Advanced Resources and Energy Engineering                                              | 54 |
| 30580 Solid Waste Management                                                                 | 55 |
| 30450 Urban and Regional Planning                                                            | 56 |
| 31520 Transportation Management Engineering                                                  | 57 |
| 31750 Rock Engineering                                                                       | 58 |
| 31760 Rock Engineering                                                                       | 59 |
| 31510 Geoenvironmental Engineering                                                           | 60 |
| 31800 Materials and Plasticity                                                               | 61 |
| 32300 Geological and Geophysical Survey,Field Excursion                                      | 62 |

## Introduction to Global Engineering

Introduction to Global Engineering

【Code】 35010 【Course Year】 1st year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 【Lecture Form(s)】 Lecture 【Language】 【Instructor】 Related Faculty members

【Course Description】 This course focuses on the improving students' understanding about the Global Engineering. The course also explores the way how the global engineering contributes to sustainability of human society on a global scale. In addition, this course is designed to provide students with a personal and professional foundation for working in professions and roles that utilize knowledge of the global engineering.

【Grading】 Coursework will be graded based on the reports and attendance.

【Course Goals】 To understand conceptions of the global engineering. To understand subjects and contents which they should study at the department of global engineering within 4 years.

【Course Topics】

| Theme                       | Class number of times | Description                                                                                                                                                                                                                                                                    |
|-----------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Guidance                    | 1                     | Introduction to the course.                                                                                                                                                                                                                                                    |
| Safety & Engineering ethics | 1                     | Introduction to the safety on their study and research, and engineers' obligations to the public, their clients, employers and the profession.                                                                                                                                 |
| Lecture                     | 5                     | Major roles in solving problems on a global scale from civil, environmental and resources engineering point of views.                                                                                                                                                          |
| Small group seminar         | 6                     | Each small group of participants visits a laboratory associated with the global engineering and take a seminar. Students have to choose a theme relating to the global engineering as a group project and perform the project under supervision of a faculty member concerned. |
| Visit Laboratories          | 1                     | Visit laboratories of the global engineering department to widen students' knowledge and to deepen their understanding of the role and importance of the global engineering.                                                                                                   |

## Exercises in Infrastructure Design

### Exercises in Infrastructure Design

【Code】 35020 【Course Year】 1st year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 【Lecture Form(s)】 Seminar 【Language】 【Instructor】 Shimamoto

【Course Description】 The purpose of this course is to understand how Civil Engineering relates to our society. For the sake of this purpose, this course firstly explains the target area and new topics related to Civil Engineering with some concrete examples. Then, students examine one of the social infrastructure in their countries and make a presentation. After introducing brainstorm and KJ method, which is methods for structuring problems, students discuss disirable social infrastructure with group members and make a presentation about the result.

【Grading】 The total point is scored based on the attendance rate and the report of the exercise

【Course Goals】 To understand how Civil Engineering relates to and contributes to our society. Furthermore, throughout the exercise, it is expected to enhance the ability of discussion for reaching solutions and the ability of making a presentation of the solutions.

### 【Course Topics】

| Theme                             | Class number of times | Description                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Guidance                          | 1                     | Introduction of this course                                                                                                                                                                                                                                                                                                   |
| Introduction of Civil Engineering | 2                     | To help the exercise, the target area of civil engineering is explained with some concrete examples.                                                                                                                                                                                                                          |
| Individual exercise               | 1~2                   | Students are asked to pick up one of the social infrastructure in their own countries and to summarize the outline about it.                                                                                                                                                                                                  |
| Presentation                      | 2~3                   | Each student is asked to make a presentation about the social infrastructure he/she examined.                                                                                                                                                                                                                                 |
| Structuring problems              | 2                     | For designing infrastructures appropriately, it is important to reveal problems in the society and find their solutions. For the sake of this, the concept of brainstorm and KJ method, which can help structuring problems, is explained. Furthermore, to understand the concept of these method, the exercise is conducted. |
| Group exercise                    | 3~4                   | Students are divided into several groups and discuss disirable social infrastructure with group members.                                                                                                                                                                                                                      |
| Presentation                      | 2                     | Each group is asked to make a presentation about disirable social infrastructure based on the discussion.                                                                                                                                                                                                                     |

## Exercises in Information Processing Basics

Exercises in Info Processing Basics

【Code】 23050 【Course Year】 1st year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 1

【Restriction】 【Lecture Form(s)】 Seminar 【Language】 【Instructor】 Tamrakar · Flores

【Course Description】 The aim of this lecture is to learn the basic skills needed for engineering computing. A UNIX based OS will be used (Linux) in terminals at the Media Center.

【Grading】 The grading will be based on the results of the weekly exercises, the final report and the written exam.

【Course Goals】 To understand and master: "program writing for problem solving," "program execution," "making graphics from numerical results," and "writing reports."

### 【Course Topics】

| Theme                                       | Class number of times | Description                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Overview, character input and file creation | 3                     | Information security (highly recommended to follow the information security e-learning course), introduction of available Media Center software, perform basic operations from the terminal such as login, logout, input of alphabet and Japanese characters, create, save and print documents, and submission of results. |
| UNIX command shell                          | 2                     | Use of basic UNIX commands, understanding of the file system, build redirections and pipes to deal with important files.                                                                                                                                                                                                   |
| Formatting text                             | 3                     | Text formatting using LaTeX. Inclusion of charts, graphics, tables and equations                                                                                                                                                                                                                                           |
| Graphics                                    | 2                     | Basics of charting (plot, axis scale, notes). Use of GNUPLOT to graphic functions and numerical data.                                                                                                                                                                                                                      |
| Programming                                 | 4                     | Basics of programming. Understanding of the structure of programs and how to alter their flow by using repetition and conditional branching. Use of Fortran to create actual programs.                                                                                                                                     |

【Textbook】 "Exercises in Information Processing Basics," provided during the first lecture.

【Textbook(supplemental)】 Stephen Chapman: "Fortran for Scientists and Engineers: 1995-2003"

【Prerequisite(s)】 None

### 【Web Sites】

【Additional Information】 This class is mainly for International Course Students. This lecture is done using Media Center equipment, for which a valid account at the Educational Computers System of Kyoto University (ECS-ID) is required. Office hours of the instructors will be provided at the first lecture. It is strongly recommended that you take "Information Processing Basics" after this course. The "Computer Programming in Global Engineering" lecture will be conducted with the assumption that students have mastered this course.

## Information Processing Basics

### Information Processing Basics

【Code】 22050 【Course Year】 1st year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2  
 【Restriction】 【Lecture Form(s)】 Lecture 【Language】 【Instructor】 Kim( C )

【Course Description】 This course focuses on improving students basic knowlegde on hardware and software of computers even including the information network. In addition, the course provides lectures on safety of networks and information ethics.

【Grading】 Coursework will be graded based on the final exam, take home exams and attendance.

【Course Goals】 To understand basic knowlegde on hardware, software and network of computers.

#### 【Course Topics】

| Theme                                         | Class number of times | Description                                                                                                                                                          |
|-----------------------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global Engineering and Information Processing | 1                     | Introduction to information processing in the global engineering using examples of how the information processing is applied to the field of the global engineering. |
| Introduction to computer                      | 1                     | Introduction to computer, which covers the structure of computers, a history of computers, computer literacy, etc.                                                   |
| Introduction to digital information           | 1                     | Advantages of using digital information, how to express digital data, data compression, etc.                                                                         |
| Computer and data communication               | 1                     | Basics for data communication, LAN, Internet, Search engines, etc.                                                                                                   |
| Introduction to programming                   | 2                     | Introduction to various types of programming languages: FORTRAN, C, JAVA, etc.                                                                                       |
| Algorithm                                     | 1                     | Designing for an algorithm and deepen knowledge for algorithm through excercises.                                                                                    |
| Basics of hardware design                     | 1                     | Baisic for the structures of hardware of computers, algebra of logic, etc.                                                                                           |
| Computer as a system                          | 1                     | Hierarchy of memory, OS, parallel computing, etc.                                                                                                                    |
| Information processing                        | 1                     | Database, searching algorithm, computer graphics, etc.                                                                                                               |
| Intellectual information processing           | 1                     | Artificial intelligence, pattern recognition, etc.                                                                                                                   |
| Problems to be solved in computer science     | 1                     | Software engineering, game theory, the next generation computer, etc.                                                                                                |
| Information ethics                            | 2                     | Introduction to information ethics.                                                                                                                                  |

【Textbook】 Materials and handouts will be distributed by the instructor.

【Textbook(supplemental)】 TBA

【Prerequisite(s)】 Participants should completed the course "Exercises in Information Processing Basics".

## Computer Programming in Global Engineering

Computer Programming in Global Eng

【Code】 35030 【Course Year】 1st year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 【Lecture Form(s)】 Seminar 【Language】 【Instructor】 Tamrakar · Flores

【Course Description】 This course aims to introduce the basic IT tools needed in Global engineering fields, and to learn and practice a computer programming language. This course will focus on a scientific language, Fortran90, that will be used to make calculations and programs.

【Grading】 This course will grade the student's ability to do programming using Fortran90, via small tests, reports and a final exam.

【Course Goals】 To understand basic IT processing capabilities in Global engineering areas. To acquire basic logic and syntax Fortran90 programming knowledge.

### 【Course Topics】

| Theme                        | Class number of times | Description                                                                                                                                                                                                                                                                                 |
|------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Overview                     | 1                     | Use of computers in Global engineering, IT and future needs. Overview on using computer terminals and description of programming language (Fortran90)                                                                                                                                       |
| I/O parameters and variables | 1                     | Main parts of a basic program: input, calculations, output, intrinsic functions, etc. Data types and commanding statements are also described.                                                                                                                                              |
| Branches and Loops           | 2                     | Conditional branching to change the flow of a program and create repetition is explained. The structure of a program is explained by using a flow chart.                                                                                                                                    |
| Array                        | 2                     | The array concept is explained for practical calculations, and its declaration and operation methods (declaration, I/O, multiplication, referencing) are explained via a programming exercise.                                                                                              |
| File I/O                     | 2                     | The basics of reading and writing to disk files is presented. Methods and formats will be explained via an example.                                                                                                                                                                         |
| Subroutines                  | 2                     | Explanation of the use of subroutines and function subprograms to work with large-scale programs.                                                                                                                                                                                           |
| Applied Calculation          | 4                     | Programming based on all previously explained examples of computational geo-engineering. A report will be submitted after an algorithm and flowchart are prepared dealing with all those topics (statistics, chart creation, random number generation, simulation, numerical methods, etc.) |

## Probabilistic and Statistical Analysis and Exercises

確率統計解析及び演習

【Code】 30030 【Course Year】 2nd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 【Lecture Form(s)】 【Language】 【Instructor】 S.Tohno, E.Nakakita, T.Hori and H.Shimamoto

【Course Description】 Theory and methodology of probabilistic and statistical analysis is introduced as a basic tool to cope with uncertainty in natural and social systems dealt with in global engineering. The main topics are concept and basic theorems of probability, probability distributions and its use, statistical estimation and testing, and multivariate analysis.

【Grading】 Grading is done based on the mark on regular examination. Performance in classes and exercises, marks in quiz and mid-term exams are also taken into account. Minimum passing grade is sixty percent.

【Course Goals】 The goal is to understand fundamental theory of probability and to be capable of using well-known distributions to analysis and design. It is also required that students understand the fundamentals on population and samples, and principle of statistical estimation and testing

### 【Course Topics】

| Theme                                   | Class number of times | Description                                                                                                                                                                                                                                                                       |
|-----------------------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction                            | 1                     | Role of probabilistic and statistical approach in global engineering and in other engineering fields                                                                                                                                                                              |
| Basic theory for probabilistic analysis | 4                     | The concept and basic theory on probability: random variables, probability mass function, probability density function, distribution function, Bayes' theorem, moment generating function, characteristic function, multi-dimensional distribution, transform of random variables |
| Probability distribution models         | 4                     | Probability distributions often used in global engineering are introduced: Bernoulli series and binomial distribution, Poisson series and distribution, normal distribution, return period.                                                                                       |
| Statistical estimation and testing      | 3                     | Basic theory on sampling. Chi-square, t-, and F-distributions. Methods for statistical estimation and testing.                                                                                                                                                                    |
| Multivariate analysis                   | 2                     | Basic methods in multivariate analysis: regression analysis and principal component analysis                                                                                                                                                                                      |

## Introduction to Civil Engineering I

社会基盤デザイン I

【Code】 31810 【Course Year】 2nd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】

【Instructor】 J. Kiyono, S. Nishiyama, Y. Tachikawa, and N. Uno

【Course Description】 Civil Engineering is the study which provides the essential technology and knowledge to improve social infrastructures. Various science, technology and knowledge are required in order to realize "convenient and comfortable cities", "safe countries to live in", "eco-friendly global society" and "sustainable civilization based on resources and energy". As an introduction to learn Civil Engineering, this course explains the essence of Civil Engineering from four fields in Civil Engineering (Structural Engineering, Hydraulics and Hydrology, Geotechnical Engineering and Planning and Management). Throughout the lectures and exercises including visiting lecturers, it is expected to learn the essence of Civil Engineering and the ethic of the engineering.

【Grading】 The score is evaluated comprehensively from reports for each lecture (including presence point) and the final examination. The full score is 100 marks which consists of 50 marks from reports and 50 marks from the final examination.

【Course Goals】 To understand that Civil Engineering is the organization of the technology and knowledge related to social capital improvement, prevention or mitigation of disaster and creation of environment.

### 【Course Topics】

| Theme                             | Class number of times | Description                                                                                                                                                                                                                                |
|-----------------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction to Civil Engineering | 2-3                   | The content of the course is introduced. Then, the study field of Civil Engineering including latest topics and the ethic of Civil Engineers throughout the achievement of predecessors is introduced.                                     |
| Structural Engineering            | 3                     | Civil Engineering is introduced in the viewpoint of Structural Engineering, which includes natural disasters and structural engineering, introduction of new technology and research, the collaboration with other fields, etc.            |
| Hydraulics and Hydrology          | 3                     | Civil Engineering is introduced in the viewpoint of Hydraulics and Hydrology, which includes conservation and construction of river environment, prediction of rainfall and flood, prediction of environmental change, global warming etc. |
| Geotechnical Engineering          | 3                     | Civil Engineering is introduced in the view point of geotechnical Engineering, which includes soil mechanics, soil environment, international cooperation, etc.                                                                            |
| Planning and Management           | 3                     | Civil Engineering is introduced in the view point of designing and managing social Infrastructure, which includes an asset management of social infrastructure, soft measures for traffic jam, logistic vehicles in urban area, etc.       |

## Soil Mechanics I and Exercises

土質力学 I 及び演習

【Code】 31620 【Course Year】 2nd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 【Language】

【Instructor】 Oka, Katsumi, Inui, Kimoto, Shiotani, Mimura

【Course Description】 The student is expected to learn:the basics of soil formation, classification for engineering purposes, soil compaction, soil water and water flow, consolidation theory, problems on final and time rate of consolidation, the fundamentals of shear strength and deformation behaviour of different soils.

【Grading】 Grading Policy:Final exam(70%), Midterm exams and assigned homeworks(30%)

【Course Goals】 After undergoing this course, the student gains adequate knowledge on engineering properties of soil.

Course objective is to provide a fundamental understanding of mechanical behavior of soil materials, including soil classification, compaction, permeability, consolidation, and strength.

### 【Course Topics】

| Theme                                      | Class number of times | Description                                                                                                                                         |
|--------------------------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

## Structural Mechanics I and Exercises

### 構造力学 I 及び演習

【Code】30080 【Course Year】2nd year 【Term】2nd term 【Class day & Period】 【Location】 【Credits】2 【Restriction】No Restriction  
【Lecture Form(s)】 【Language】 【Instructor】

【Course Description】 The following topics are covered: external forces exerted on structures; properties of forces; sectional forces; stress; strain and displacement/deformation; cross sectional properties; relationship between stress and strain; computation of displacement; buckling of column. Statically determinate structures are to be focused on.

【Grading】 Grade is given based on the final examination, mid-term examination and reports.

【Course Goals】 To understand the methods for studying structures at static equilibrium conditions; to understand stress and strain, and the relationship between them; to understand the buckling phenomenon in columns.

#### 【Course Topics】

## Dynamics of Soil and Structures

波動・振動学

【Code】 31110 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 This course deals with fundamentals and application of vibration theory and elastic wave propagation in civil engineering.

【Grading】 Based on the performance during the course (including homework) and the results of a final examination.

【Course Goals】 At the end of this course, students will be required to have a good understanding of:

- Vibration phenomena, response to dynamic loads, fundamental principle of vibration measurement, including manipulation of mathematical manipulation and calculation
- Treatment of vibration problems for multi-degree-of-freedom systems and elastic media
- Fundamental properties of elastic waves that propagate in elastic media and layers

【Course Topics】

| Theme                                                             | Class number of times | Description                                                                                                                                                 |
|-------------------------------------------------------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vibration of structures and equation of motion                    | 1                     | Vibration phenomena encountered in civil engineering structures. Importance and engineering issues of vibration. Derivation of equation of motion.          |
| Free vibration                                                    | 1                     | Definition of the natural period and damping ratio for single degree-of-freedom systems. Derivation of free vibration response.                             |
| Force vibration                                                   | 1                     | Resonance curves and phase response curves for forced harmonic vibration. Frequency response characteristics.                                               |
| Principle of vibration measurement                                | 1                     | Background theory of vibration measurement. Accelerometers and seismometers.                                                                                |
| Response to arbitrary input                                       | 2                     | Evaluation of dynamic response to arbitrary forcing and earthquake excitation. Response spectra.                                                            |
| Nonlinear vibration                                               | 1                     | Fundamental properties of nonlinear dynamic response of structures associated with elasto-plastic behavior.                                                 |
| Vibration of 2-DOF systems                                        | 1                     | Solution of equations of motions for 2-degree-of-freedom systems representing free vibration. Concept of normal vibration modes.                            |
| Natural frequencies and natural modes of vibration                | 1                     | Relationship between the natural frequencies, normal vibration modes of multi-degree-of-freedom systems and eigenvalue analysis.                            |
| Damped free vibration of MDOF systems                             | 1                     | Vibration of multi-degree-of-freedom systems with damping. Analysis of MDOF systems using damping using normal vibration modes.                             |
| Forced vibration and response to arbitrary input for MDOF systems | 1                     | Modal analysis to evaluate the dynamic response of multi-degree-of-freedom systems for harmonic and arbitrary excitation.                                   |
| Vibration of continuum                                            | 1                     | Vibration of shear beams. Flexural vibration. Wave equation. Solution of shear vibration problem.                                                           |
| Elastic wave                                                      | 1                     | Properties of elastic waves travelling in elastic media and elastic layers. Fundamental concept in deriving solutions of elastic wave propagation problems. |

【Textbook】 Not used; Class hand-outs are distributed when necessary.

## Fundamental Theory of Elasticity and Stress Analysis

弾性体の力学解析

【Code】 32000 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 4

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】

【Instructor】 Assoc. Prof. Tsukada & Assoc. Prof. Murata

【Course Description】 Stress, strain, displacement and basic equations in linear elasticity are first lectured, and then Airy's stress function and its application to solve two dimensional problems in linear elasticity are explained. Moreover, energy theorems and their application to a numerical stress analysis method are explained.

【Grading】 Several Exercises are presented in the term. Midterm exam and final exam are also presented. Grade is evaluated by the sum of the exercises and the exams. The weight for grading is 30% and 70% respectively.

【Course Goals】 One objective of this course is to master the basis in linear elasticity to solve the problems analytically and numerically. Another one is to obtain the basic knowledge for the programming a numerical stress analysis method such as FEM and BEM.

### 【Course Topics】

| Theme                                                                | Class number of times | Description                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stress, strain and displacement                                      | 2                     | Introduction of linear elasticity containing its history is first presented, and then stress, strain, displacement, equations between them, principal stress and strain, Mohr's circle of stress and strain, and etc. are lectured.                                                                                                         |
| Basic equations of linear elasticity and boundary condition          | 2                     | Basic equations of linear elasticity in Cartesian coordinate system and polar coordinate system are presented, and then the methods to solve the equations are lectured.                                                                                                                                                                    |
| Airy's stress function and solution of 2D problem of elasticity      | 5                     | Airy's stress function that is a biharmonic function is presented for Cartesian coordinate system and polar coordinate system, and a method to obtain the stress and displacement in a two dimensional elastic body using Airy's stress function is lectured.                                                                               |
| Energy theorems in elasticity and solution of boundary value problem | 3                     | Strain energy function, principle of virtual work, and principle of minimum potential energy are lectured, and then the relation between basic equations in linear elasticity and these energy principle is lectured. Moreover the method to solve a boundary value problem in linear elasticity based on the energy theorems is explained. |
| Numerical stress analysis                                            | 2                     | Overview of FEM, FDM and BEM is presented, and then formulation of FEM using the energy theorems is explained. Moreover some examples of stress analysis using FEM and BEM are shown.                                                                                                                                                       |

【Textbook】 Not specified.

【Textbook(supplemental)】 Shigeo Takezono et al., Introduction of Mechanics of elasticity-from basic theory to numerical analysis-, Morikita Publishing Co., ISBN:978-4-627-66641-2

【Prerequisite(s)】 Differential calculus, integral calculus, and linear algebra are necessary for taking this course.

【Web Sites】 This course does not have a web site. But some lecture documents may be derived by the net. The URL to download the lecture documents will be announced in the class.

【Additional Information】 Additional information is presented in the first class of each teacher.

## Construction Materials

材料学

【Code】 30240 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 Knowledge and techniques to use construction structural materials from micro-structures to macro-structures are introduced.

【Grading】 Evaluate considering the scores of final examination and the submitted reports.

【Course Goals】 The student will understand the properties, production and testing methods of concrete, steel, composite materials etc. In addition, the student will understand the way of thinking for construction materials.

### 【Course Topics】

| Theme                          | Class number of times | Description                                                                                                                                                                        |
|--------------------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction                   | 1                     | Classification of materials, history of construction materials, ethics for civil engineers and current topics are introduced                                                       |
| Crystal structure              | 1                     | Bond between atoms, ideal strength, dislocation, yield, and mechanical properties are introduced.                                                                                  |
| Metallic material              | 1                     | Iron, blast furnace, refine, steel, transformation, heat treatment and metallic new materials are introduced.                                                                      |
| Corrosion & protection         | 1                     | durability, corrosion, deterioration mechanism, carbonation, chloride induced corrosion and corrosion protection are explained.                                                    |
| Cement                         | 1                     | Types of cements, chemical composition, chemical compound, hydration, hydration heat and blended cement are introduced.                                                            |
| Admixture                      | 1                     | Chemical admixture, water-reducing admixture, air-entraining admixture, mineral admixture, pozzolanic reaction, latent hydraulic property and high-range admixture are introduced. |
| Aggregate                      | 1                     | Moisture condition, Chloride ion, Total chloride ion content, alkali-silica reaction and total alkali content are explained.                                                       |
| Fresh concrete                 | 1                     | Workability, rheology, consistency, segregation and mix design are introduced.                                                                                                     |
| Hardened concrete              | 2                     | water cement ratio, compressive strength, flexural strength, tensile strength, durability and testing methods are introduced.                                                      |
| Non-destructive testing method | 1                     | Surface hardness, ultrasonic pulse, thermography, half cell potential and polarization resistance are explained.                                                                   |
| Special concrete               | 1                     | Fiber reinforced concrete, flowing concrete, MDF cement and mineral new materials are explained.                                                                                   |
| Polymer material               | 1                     | Resin, rubber, fiber, polymer concrete and organic new materials are explained.                                                                                                    |
| Asphalt & topics               | 1                     | Asphalt, straight asphalt, blown asphalt, asphalt emulsion and current topics are explained.                                                                                       |
| Final examination              | 1                     | The final examination is to be given during the final exam period.                                                                                                                 |

## Structural Mechanics II and Exercises

構造力学 II 及び演習

【Code】 31640 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 3

【Restriction】 No Restriction 【Lecture Form(s)】 【Language】 【Instructor】

【Course Description】 Fundamentals of structural analysis based on energy principle

Principle of virtual work and some energy principles for structural analysis

Approaches for study of statically indeterminate structures

Fundamentals of elastic stability

Fundamentals of structural analysis by matrix methods

【Grading】 Grade is given based on the final examination, mid-term examination and reports.

【Course Goals】 To solve structures such as truss and beam by the principle of virtual work/energy principles

To solve statically indeterminate structures by force method and displacement method

To understand the stability of equilibrium

to get the stiffness matrix of simple trusses

【Course Topics】

| Theme                                            | Class number of times | Description                                                                                                                                                                      |
|--------------------------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Work, energy and virtual work                    | 13                    | Introduction                                                                                                                                                                     |
|                                                  |                       | Work, virtual work and energy                                                                                                                                                    |
|                                                  |                       | Castigliano ' s theorems and principle of minimum potential energy                                                                                                               |

| Reciprocal theorems                              |                       |                                                                                                                                                                                  |
| Static determinate and indeterminate             | 1                     | Degree of freedom and degree of indeterminacy                                                                                                                                    |
| Solutions to statically indeterminate structures | 6                     | Introduction of force method and displacement method                                                                                                                             |
|                                                  |                       | By equations of elasticity<br>By displacement method                                                                                                                             |
| Structural stability                             | 3                     | Stability criteria                                                                                                                                                               |
|                                                  |                       | Deformation of rigid body-elastic spring system<br>Deformation of elastic beam- column system                                                                                    |
| Basis of matrix method of structural analysis    | 4                     | Matrix adapted to equilibrium equations/displacement conditions                                                                                                                  |
|                                                  |                       | Analysis of plane truss                                                                                                                                                          |
| Structral analysis engineer's ethics             | 1                     | Examples on structral analysis engineer's ethics related to safety of structure analyses such as application scope, precision of analysis and reliability of structural analysis |

【Textbook】 To be informed by individual lecturer in charge in his/her first lecture

【Textbook(supplemental)】 M. Matsumoto, E. Watanabe, H. Shirato, K. Sugiura, A. Igarashi, T. Utsunomiya, Y. Takahashi: Structure mechanics , Maruzen Ltd.

【Prerequisite(s)】 calculus A and B, Linear Algebra A and B, Structure mechanics and Exercises

【Web Sites】

【Additional Information】 There are four classes which will be taken in the meantime by corresponding teacher. Office hour (contact information and consultation hours) of the individual lecturer will be given in his/her first lecture.

## Hydraulics and Hydrodynamics

水理水工学

【Code】 31360 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 Lecture of fundamental theories of fluid dynamics and applications to hydraulic engineering

Basic equations, potential flow theory, boundary layer theory and turbulent flow Introduction of basic modelings about fluid motion and heat transfer in atmosphere related to hydrology and meteorology

【Grading】 Attendance, reports and final examination

【Course Goals】 Learning elementary knowledge of hydraulics and important topics of hydrodynamics science

【Course Topics】

| Theme                                       | Class number of times | Description                                                                                                         |
|---------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------|
| Introduction                                | 1                     | Academic history of hydraulics and fluid dynamics                                                                   |
| Momentum equation and potential flow theory | 1-2                   | Theories of perfect fluid and potential flow                                                                        |
| Basic study of boundary layer theory        | 1 -2                  | Appearance of boundary layer theory                                                                                 |
| Application of boundary layer theory        | 1                     | Application of boundary layer theory to hydraulic engineering                                                       |

## Continuum Mechanics

連続体の力学

【Code】 31170 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】 Oka, F. and Hosoda, T.

【Course Description】 Continuum Mechanics is a branch of the physical sciences concerned with the deformations and motions of continuous media under the influence of external effects.

The following basic items are explained with exercises: Fundamentals of tensor analysis, Mathematical formulation of strain, motion and stress, Conservation laws of continuous media (mass, momentum, angular momentum, energy), Constitutive laws of elastic body and Newton fluids, Principle of virtual work and minimum potential energy based on the calculus of variations, Finite Element Method, Applications in Elasticity and Fluid Dynamics.

【Grading】 Regular examination (90 p.c.) and Midterm examination(10 p.c.)

【Course Goals】 Based on the clear understanding of the mathematical formulation on deformation, stress and constitutive laws, students are requested to understand the derivation of the Equation of motion, Conservation laws of angular momentum and energy, certainly. Principle of virtual work and minimum potential energy are attached importance as the basis of Finit Element Method.

### 【Course Topics】

| Theme                                                  | Class number of times | Description                                                                                                                                                                                        |
|--------------------------------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Elementary knowledge on tensor analysis                | 2                     | Definition of tensors, Integral theorem, Material derivative over a material volume, Transformation of components of tensors, etc.                                                                 |
| Stress, strain and strain rate tensors                 | 2                     | Definition of stress, strain and strain rate tensors, Transformation of components of these tensor variables, Invariants under coordinates transformation, Compatibility condition of strain, etc. |
| Mathematical formulation of conservation laws          | 2-3                   | Mathematical expression of conservation laws of continuous media (mass, momentum, angular momentum, energy)                                                                                        |
| Constitutive law of solids and fluids                  | 2-3                   | Constitutive laws of elastic & visco elastic body and Newton fluids                                                                                                                                |
| Principles based on the calculus of variations and FEM | 2                     | Principle of virtual work and minimum potential energy based on the calculus of variations, Finite Element Method, etc.                                                                            |
| Applications in elasticity and fluid dynamics          | 3                     | Applications in Elasticity and Fluid Dynamics                                                                                                                                                      |

【Textbook】 Printed materials on the contents of this class are distributed in class.

【Textbook(supplemental)】

【Prerequisite(s)】 Elementary knowledge on differential and integral calculus and linear algebra

# Fundamentals of Hydrology

## 水文学基礎

【Code】 30300 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】 M. Shiiba, K. Takara, Y. Tachikawa and S. Kim

【Course Description】 The fundamental concept of hydrology is the hydrological cycle, which is various scale physical processes of water movements in the atmosphere, continents, and oceans. Solar energy and gravity forces play major roles for the hydrological cycle. Solar energy drives the dynamic processes of water vapor formation from oceans and continents, and transport of vapor in the atmosphere. The vapor changes to liquid and fall the the surface of the Earth as precipitation, then the flow of water on and under the Earth ' s surface are driven by gravity. Hydrology is the study of the movement of water on and under the surface of the Earth and its applications to mitigate water-related disasters, develop water resources and preserve the environment. In the class, basic hydrological processes and numerical representations of the hydrological processes are described. Concepts of probability in hydrology is also explained for the hydrological design.

【Grading】 The score is evaluated comprehensively with a quiz for each lecture, reports and and the final examination.

【Course Goals】 1) To understand basic equations of hydrological processes to phisically analyse the hydrologic phenomenon, and 2) based of the understanding of hydrological processes, to aquire the basis of hydrologic design and planning.

### 【Course Topics】

| Theme                                           | Class number of times | Description                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The Hydrologic Cycle                            | 1                     | The contents of the class is overviewed and the concept of the hydrological cycle is provided. The role of hydrology in the field of civil engineering is described.                                                                                                                                                                                                            |
| Solar Radiation and Energy Balance of the Earth | 1 ~ 2                 | Energy and water cycle driven by solar radiation is described. Land surface information obtained by satellite remote sensing is explained.                                                                                                                                                                                                                                      |
| Precipitation                                   | 1                     | The mechanism of precipitation is described. A numerical rainfall prediction model and the mechanism of radar rainfall observation are described.                                                                                                                                                                                                                               |
| Evaporaion and Transpiration                    | 2.5                   | The mechanism of water and energy cycle through evapotranspiration is described. Energy balance at land surface and the wind of boundary layer is introduced. Then, methods to measure the evapotranspiration is described.                                                                                                                                                     |
| Infiltration and Unsaturated                    | 1.5                   | The mechanism of unsaturated flow and infiltration is described. The governing equation of unsaturated flow and the basic equations of the potential infiltration are explained.                                                                                                                                                                                                |
| Slope Runoff                                    | 2                     | The mechanism of rainfall-runoff in mountainous slope is explained. The kinematic wave equation is derived from the momentum equation of water flow, and then the analytical solutions of the kinematic wave model are provided. Rainfall-runoff modeling using the kinematic wave equation is explained.                                                                       |
| Flood routing                                   | 1.5                   | The mechanism of flood routing is explained. Numerical representation method to represent channel network structure is introduced, then typical flow routing methods are described.                                                                                                                                                                                             |
| Rainfall-runoff Model                           | 1.5                   | A physically-based rainfall-runoff model which consists of various hydrologic processes is described. Typical lumped hydrologic models are also introduced.                                                                                                                                                                                                                     |
| Frequency Analysis in Hydrology                 | 2                     | Frequency analysis of hydrologic variables is introduced. To analyze the frequency and magnitude of extreme hydrologic variables, fitting of distribution functions, return period, and T-year hydrologic variable are explained. The methods to evaluate the fitting of distribution functions and uncertainty of the probabilistic hydrological variables are also described. |

## Soil Mechanics II and Exercises

土質力学 II 及び演習

【Code】 31070 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 3

【Restriction】 No Restriction 【Lecture Form(s)】 【Language】 【Instructor】 Ohtsu, Oka, Kimura, Iai, Nishiyama

【Course Description】 The student is expected to learn:soil consolidation and stress distribution in soil media, shear strength of soil, lateral earth pressure-active and passive conditions, bearing capacity of shallow and deep foundations, stability of slope and soil dynamics.

【Grading】 Grading Policy:Final exam(70%), Midterm exam and assigned homework(30%)

【Course Goals】 The course objective is to provide an understanding of key engineering properties and mechanical behavior of soil materials including consolidation, shear deformation and strength properties, bearing capacity of foundations, stability of slopes and excavations, and dynamic properties of soil.

At the end of the course, students will be able to:

- 1.Understand the principles of strength and deformation behavior of different soils.
- 2.Understand and apply the fundamentals of soil mechanics and geotechnical compitition methods.
- 3.Understand the soil-structutes interaction.

### 【Course Topics】

| Theme                                | Class number of times | Description                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consolidaton                         | 2                     | Understand Terzaghi's theory of consolidation, laboratory consolidation test, field consolidation curve, normally consolidated condition and over consolidated condition, and problems on final and time rate of consolidation.                                                                           |
| Stresses in ground                   | 1                     | Understand stresses in the ground due to loading, soil strength and pressure distribution below foundation.                                                                                                                                                                                               |
| Shear derormation and shear strentgh | 2                     | Understand measurement of shear strength and triaxial compression tests, strength parameters, drained and undrained behavior of clay and sand, and stress path for conventional triaxial test.                                                                                                            |
| Theories of earth pressure           | 2                     | Understand the lateral earth pressure in active and passive states, Rankine's theory in cohesive and cohesionless soil, Coloumb's wedge theory with condition for critical failure plane, earth pressure on retaining walls of simple configurations.                                                     |
| Midterm exam                         | 0.5                   |                                                                                                                                                                                                                                                                                                           |
| Bearing capacity of foundation       | 1.5                   | Understand the definition of bearing capacity, ultimate bearing capacity, net ultimate bearing capacity, net safe bearing capacity and allowable bearing pressure, and derivation of Terzaghi's general bearing capacity equation for continuous footing and basic numerical problems associated with it. |
| Slope stability                      | 2                     | Understand the failure mechanisms of both infinite and finite slopes and methods of slope stability analysis.                                                                                                                                                                                             |
| Soil dynamics                        | 2                     | Understand the nature of dynamic loads, mchanism of liquefaction and liquefaction parameters, and stress conditions on soil element under earthquake loading.                                                                                                                                             |
| Infrastructure and ground            | 1                     | Understand the recent geoengineering projects and ethical responsibility for geoengineers.                                                                                                                                                                                                                |

【Textbook】 Text book:Fusao Oka,"Soil Mechanics",Asakura publishing Co., Ltd.

【Textbook(supplemental)】 Fusao Oka,"Soil Mechanics Exercises",Asakura publishing Co., Ltd.

【Prerequisite(s)】 A required prerequisite is knowledge of soil mechanics. Soil mechanics I and Exercises(31620) would be helpful as a prerequisite.

## Experiments on Soil Mechanics and Exercises

土質実験及び演習

【Code】 31380 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Seminar and Exercise 【Language】

【Instructor】 Inui, Kishida, Kimoto, Shiotani, Nishiyama, Mimura, Inazumi, Koyama, Takai, Higo, Goto, Tobita

【Course Description】 The first aim of this course is to acquire laboratory and in situ testing methods to assess engineering properties of soil, which were taught in the soil mechanics course.

【Grading】 Laboratory: Each student is expected to conduct the experiments to gain hands on experience.

Attendance: Full attendance to lecture and laboratories is compulsory.

Grading policy: Laboratory Report, 100% of the course grade.

【Course Goals】 To help students in understanding the soil mechanics concepts given in the Soil Mechanics course with hands on experience.

To be able to carry out all soil mechanics fundamental experiments.

To collect, analyze and interpret experimental data.

To have a feeling of engineering properties of geomaterials.

### 【Course Topics】

| Theme                                    | Class number of times | Description                                                                                                           |
|------------------------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| Introduction and Orientation             | 1                     |                                                                                                                       |
| Physical properties of soils             | 1                     | Structure of soil, Engineering classification of soils, Consistency Limits, Grain size distribution                   |
| Compaction Test                          | 1                     | Laboratory compaction tests, Factors affecting compaction                                                             |
| Hydraulic Conductivity Test              | 2                     | Permeability and seepage, Darcy's law, Hydraulic gradient, Determination of hydraulic conductivity, Flow net analysis |
| Consolidation Test                       | 1                     | Fundamentals of consolidation, Laboratory tests, Settlement-time relationship                                         |
| Uniaxial compression test                | 1                     | Stress-strain and strength behavior of clays                                                                          |
| Direct Shear Test                        | 1                     | Mohr-Coulomb failure criterion, Laboratory tests for shear strength determination                                     |
| sounding methods                         | 0.5                   | N-values of standard penetration test and elastic wave exploration                                                    |
| Centrifuge model test                    | 0.5                   | Experiments using the similarity law of centrifuge test                                                               |
| Computer Exercise and numerical analysis | 2                     | Fundamentals of math and physics for geotechnical engineering                                                         |
| Special Lecture                          | 1                     | Special lecture on soil mechanics                                                                                     |
| Exercise & Summary                       | 2                     | Practical application of laboratory testing data                                                                      |

【Textbook】 To be announced in the class.

【Textbook(supplemental)】

【Prerequisite(s)】 Soil mechanics I and exercises(31620)

It is recommended to take soil mechanics II and exercises in parallel.

## Planning and Management of Social Systems

社会システム計画論

【Code】 30440 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 The aim of “ Planning and Management of Social Systems ” is to provide the basic knowledge of infrastructure planning and management, and show the basic concepts and frameworks of typical models that are indispensable for systems analyses. Moreover the lecture introduces theories in social psychology and ethnography. It further covers the methods of social survey and problem structuring where group works with presentation are scheduled.

【Grading】 On the presumption of sufficient attendance, 30% of score is valued on reports and 70% on examination.

【Course Goals】 It is targeted to understand roles of infrastructure planning and management, typical models for systems analysis, methods of social survey and problem structuring. It is further expected to enhance the ability of discussion for reaching solutions.

【Course Topics】

| Theme                            | Class number of times | Description                                                                                            |
|----------------------------------|-----------------------|--------------------------------------------------------------------------------------------------------|
| Guidance                         | 1                     | Problems of infrastructure planning and management, and its methodology. Abstract of systems analysis. |
| Queuing theory                   | 1                     | Fundamental structure of queuing system. Formulation and solution of M/M/S system.                     |
| Marcov model                     | 2                     | Marcov process. Transition probability matrix. Steady state.                                           |
| Time-series predicting model     | 1                     | Serial correlation. Auto-Regressive model. AutoRegressive-Moving Average model.                        |
| Multivariate analysis            | 1                     | Principal component analysis. Quantification theory                                                    |
| Game theory                      | 2                     | Strategic interdependency. Nash equilibrium. Typical models.                                           |
| Social survey                    | 1                     | Objective and methods of social survey. Case examples.                                                 |
| Ethnography and content analysis | 2                     | A case study: Historical change of public image of civil engineering.                                  |
| Structuring problems             | 1                     | KJ method. Interpretive Structural Modeling.                                                           |
| Comprehensive exercise           | 2                     | Group work with application of KJ method. Presentation.                                                |

【Textbook】 Systems analysis for Infrastructure planning: phenomenal analysis, Morikita pub. (in Japanese)

【Textbook(supplemental)】 None

【Prerequisite(s)】 Fundamental understanding of probability

【Web Sites】 None

【Additional Information】 Office-hours are not specified whereas the ways to make contact with teachers are informed in classes.

## Experiments on Hydraulics

### 水理実験

【Code】 30870 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Exercise 【Language】 【Instructor】

【Course Description】 Guidance of laboratory experiments in hydraulics and measurement instruments.

Eight experiments are conducted about pipe flow, open-channel flow, waves, flow in porous media, density flow, hydrodynamic force, sediment transport

【Grading】 Attendance : 40 points

Reports and homework : 60 points

total : 100 points

【Course Goals】 Understanding hydraulic phenomena through various flows observed in the hydraulic laboratory

【Course Topics】

| Theme                                                                     | Class number of times | Description                                                                                                                                                         |

## Surveying and Field Practice

測量学及び実習

【Code】 30400 【Course Year】 3rd year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 【Language】

【Instructor】 Tamura, Susaki, Hatayama, Ohba, Nakamura, Maki, Yamaguchi

【Course Description】 Lectures and field practice of the surveying are conducted. In the lectures, survey techniques, details on the instruments, adjustment of the errors contaminated in the measured data are introduced. In the field practice, the student will understand the survey procedure using the instruments.

【Grading】 Evaluate considering the scores of the intermediate and final examinations, and the reports and attendance of the field exercise.

【Course Goals】 The student will understand the background and theory to reduce the errors contaminated in the measured data and to estimate the reliable parameters.

The student will be able to derive the most probable value and standard error using the least square method and the law of error propagation.

The student will understand the purpose of the various kinds of survey.

In the field exercise, the student will acquire the preparedness to plan the survey and the attitude to cooperate with other students for the accomplishment of the survey.

### 【Course Topics】

| Theme                               | Class number of times | Description                                                                                                                                                                                                         |
|-------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction of survey              | 1                     | The purpose, history and content of the surveys are introduced. In addition, the survey applications and the advanced technology of the surveys are also introduced.                                                |
| Distance and angular measurement    | 3                     | Distance and angular measurement, simple and fundamental surveys, are introduced. The student will learn how to set the instrument properly, and the technique to measure the angles using theodolite.              |
| Control survey                      | 6                     | The survey plan for the control survey is introduced, and the practice of the traverse survey, one of the most traditional control surveys, is conducted.                                                           |
| Leveling                            | 3                     | The methodology of leveling and the adjustment of the errors are introduced, and the practice is conducted.                                                                                                         |
| Plane survey and topographic survey | 4                     | The methodology of the plane survey and topographic survey is introduced. The features of the topographic map produced through the survey are explained.                                                            |
| Theory of errors                    | 4                     | The concept of the errors and the law of the error propagation are introduced.                                                                                                                                      |
| Least square method                 | 6                     | The concept of the least square method (LSM), popular approach to the processing of the survey data, is introduced. The student will learn how to apply the LSM for the practical application through the exercise. |
| Error adjustment                    | 4                     | The methodology to adjust the errors in the traverse survey is introduced, and the student will learn how to obtain the most probable parameters through the exercise.                                              |
| Photogrammetry                      | 4                     | The overview of photogrammetry is introduced, and the practice using the instrument is conducted.                                                                                                                   |
| GPS survey                          | 4                     | The theory of GPS and GPS survey are introduced, and the practice of GPS survey is conducted.                                                                                                                       |

## Urban and Landscape Design

都市景観デザイン

【Code】 31630 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 【Language】

【Instructor】 M. Kawasaki, Y. Kubota, K. Yamaguchi

【Course Description】 To design the urban facilities, open spaces, landscapes of streets and district, is to create the place for the people and their activities. It enables to make places in harmony with the environment by making connections of each space of the city, region, and nature. The class aims to consider the vision of cityscape and learn the practical design skills and representation.

【Grading】 Total points will be scored in design practice and reports.

【Course Goals】 To understand the ways of design of the urban facilities, open spaces, landscape of streets and district. To acquire basic skills of landscape design.

【Course Topics】

| Theme                                     | Class number of times | Description                                                                                                                                                                                                                                 |
|-------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Guidance, Basic ideas of landscape design | 2                     | Significance and scope of urban and landscape design. Fundamentals of visual perception.                                                                                                                                                    |
| Theory of urban and landscape design      | 6                     | Lectures on the theories and case study of the design of cityscapes, streetscapes, waterfronts, bridges. Practice of perspective Drawings.                                                                                                  |
| Design practice                           | 6                     | Design study for the renovation planning of the university campus. Analyzing the present situation of the public space and the landscape; planning and making a design concept; and concrete images. The training of design representation. |

【Textbook】

【Textbook(supplemental)】

【Prerequisite(s)】

【Web Sites】

【Additional Information】 Office hours are not especially set. Ask any questions by mailing or visiting professors (Kawasaki, rm.202; Kubota, rm.201; Yamaguchi, rm.203 at C1-1, Katsura Campus). The theme of design practice could be changed partially.

## Urban and Regional Planning

都市・地域計画

【Code】 30450 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 This lecture aims to learn the process of urban planning and basic measures in urban facility planning, land use planning and transportation planning and to understand the basic theory and models for urban planning.

【Grading】 Grades will be based on the results of the final examinations, report and class participation.

【Course Goals】 To learn fundamental knowledge on urban planning and to understand the structure of urban problems.

【Course Topics】

| Theme                              | Class number of times | Description |

## Transportation Management Engineering

交通マネジメント工学

【Code】 31520 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 This lecture is aimed at explaining methodologies of survey, design and operation for urban traffic and transportation system, which may contribute to enhancement in safety and efficiency of travel.

【Grading】 Students will be graded considering both assignments and term paper.

【Course Goals】 The students who complete this course are expecting to explain well the significance in the methodologies used for survey, design and operation of transportation planning and traffic engineering. In addition, these students are expecting to apply the methodologies for the actual case.

【Course Topics】

| Theme                                              | Class number of times | Description |

## Rock Engineering

岩盤工学(土木工学コース)

【Code】31750 【Course Year】3rd year 【Term】2nd term 【Class day & Period】 【Location】 【Credits】2

【Restriction】No Restriction 【Lecture Form(s)】Lecture 【Language】 【Instructor】Ohtsu, Kishida

【Course Description】Design and construction technology of rock structure (Underground cavern, tunnel, rock slope, etc.), geology, mechanical properties of rock and rock fracture, laboratory tests and field measurements of rock and rock mass are introduced and lectured. Design exercise of rock structure is also introduced.

【Grading】Evaluation is decided overall as 35% first examination, 45% final examination and 20% of reports and subjects.

【Course Goals】

【Course Topics】

| Theme                                                                                                     | Class number of times | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction of Rock Engineering and Underground Space Techonology                                        | 1                     | Introduction of real examples and problems in rock engineering field in relation to rock and civil engineering, disaster prevention, energy and environmental areas. Also, outline of underground space technology which includes the benifit of underground space for human being, effective underground space utilization, etc., will be described.                                                   |
| Geology and Rock Engineering                                                                              | 1                     | Basic knowledge of geology required to study rock engineering will be explained. Deeper understanding of minerals and rocks, their compositions, geological structures and geological features, etc. will be made.                                                                                                                                                                                      |
| Mechanical propeties of rock and rock masses                                                              | 2                     | Understanding to strength and deformation characteristics of rock, experimental methods to determine those characteristics and method of interpreting the experimental results. Also, difference between rock and rock masses, non-homogeneity, anisotropy and scale effects will be explained.                                                                                                         |
| Classification and and identification of discontinuity (rock fracture)                                    | 2                     | Explanation of mechanical and hydraulic charactersics of discontinuity planes such as fault, joint, etc. and understanding the modelling of crack network .Also, understanding of stereographic projection of notation used for three dimensionaly distributed discontinuity planes.                                                                                                                    |
| Hydraulics in rocks and groundwater investigation                                                         | 1                     | Methods of understanding the behavior of underground water that flows through the rockbeds, their analysis methods and environmental problems related with it will be explained.                                                                                                                                                                                                                        |
| Methods of investigation and testing of rock masses                                                       | 3                     | Introduction of ground investigation methods such as geological survery, load test and borehole test of rock masses, geophysical exploration, intial stresses, etc. which are carried out for the design and construction of rock structures will be introduced. Understanding of principles of those methods, interpretation of data measured and the proper use of those data will also be explained. |
| Application of Rock Mechnicas in Engineering for Underground Opening, Rock Slop, Tunneling and Foundation | 3                     | Explanation of methodolgy and the problems for the construction of structures on the bedrocks such as foundation of dams and bridges and slopes is made. Also, methods of constrution of tunnels in the mountain region and representative shield method for tunneling at city area are also explained. Simple design exercises and special lecture from experienced person                             |

## Geoenvironmental Engineering

地盤環境工学

【Code】 31510 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 This course provides the knowledge on geotechnical engineering related to soft ground improvement, natural disaster mitigation, and geo-environmental issues.

【Grading】 Grading will be made based on the final exam and attendances.

【Course Goals】 The goal of this course is to understand the geotechnical engineering contributing to disaster prevention and environmental issues.

### 【Course Topics】

| Theme                     | Class number of times | Description                                                                                                                                   |
|---------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Soft ground improvement   | 3                     | (1) Principle of ground improvement, (2) innovative materials including geosynthetics, and (3) road and pavement engineering.                 |
| Environmental Geotechnics | 5                     | (1) Remediation of contaminated soils and groundwaters, (2) waste containment, and (3) reuse of waste materials in geotechnical applications. |
| Geo-disaster (1)          | 3                     | (1) Types of natural disasters, geo-disasters, hazard map, mechanism of liquefaction, (2) landslides, (3) damages to river embankment         |
| Geo-disaster (2)          | 3                     | (1) Performance-based design for geo-disaster, (2) measures against liquefaction, (3) environmental vibrations and measures.                  |
| Exam                      | 1                     |                                                                                                                                               |

# River Engineering

## 河川工学

【Code】30460 【Course Year】3rd year 【Term】2nd term 【Class day & Period】 【Location】 【Credits】2 【Restriction】No Restriction  
 【Lecture Form(s)】Lecture 【Language】 【Instructor】Hosoda, T. & Takemon, Y.

【Course Description】 We focus on technologies required for planning the integrated river management based on a wide range of knowledge on natural science and engineering. A set of the fundamental knowledge used for the purpose will be presented in the lecture with following contents: various view-points in relation to river systems, long term environmental changes of rivers and their factors, river flows and river channel processes, structure and function of river and lake ecosystems, recent characteristics of flood disasters, integrated river basin planning including flood control, sustainable reservoir management, nature restoration, and sediment transport management.

【Grading】 regular examination, quiz in class, attendance and reports

【Course Goals】 to learn the elementary knowledge and grounding to consider rivers from the various points of view such as natural science, engineering & technology and social science.

### 【Course Topics】

| Theme                                                       | Class number of times | Description                                                                                                                                                                                                                                              |
|-------------------------------------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Various viewpoints on rivers and river basins               | 1-2                   | Various viewpoints on rivers and river basins, Various rivers on the earth, Formation processes of river basins, long term environmental changes of rivers and its main factors                                                                          |
| Precipitation, water cycle and run-off phenomena            | 1                     | Elementary knowledge of Meteorology, Statistical Hydrology and Run-off Analysis                                                                                                                                                                          |
| River flow and river channel processes(1)                   | 1                     | Flood flow simulation, Sediment transport in alluvial stream                                                                                                                                                                                             |
| River flow and river channel processes(2)                   | 1                     | River morphology (segments, river meandering, sand waves), Numerical analysis of river channel processes, Sediment run-off in mountaneous areas                                                                                                          |
| Application of numerical hydraulics to environmental issues | 1                     | Prediction on vertical distributions of water qualities in a lake, Depletion of DO near the bottom of the Northern Part of Lake Biwa due to Global Warming, etc.                                                                                         |
| Structure and functions of river and lake eco-system(1)     | 1                     | Hierarchical structure and classification of river ecosystems, Relations between river geomorphology and habitat structure, Classification of microhabitats and their maintenance mechanisms, Longitudinal distribution of biological communities        |
| Structure and functions of river and lake eco-system(2)     | 1                     | Function of river ecosystems, Roles of biodiversity, Sustainable conditions of habitats for biological communities, Mass transfer mechanism in rivers, Nutrient spiraling, Impact assessment of river environments and Physical Habitat Simulation Model |
| Structure and functions of river and lake eco-system(3)     | 1                     | Function of lake ecosystems, Classification of natural lakes and ponds by thermal stratification and thermal convection, Relations between lake types and biota (fauna and flora), Characteristics of man-made reservoir ecosystems                      |
| Integrated river basin planning(1)                          | 1                     | River law, Fundamental river management plan, River improvement plan, Procedures of flood defense planning                                                                                                                                               |
| Integrated river basin planning(2)                          | 1                     | Flood invasion analysis and Hazard Map, Ecessive flood and comprehensive flood disaster prevention measures, River structures(groines and levees)                                                                                                        |
| Integrated river basin planning(3)                          | 1                     | Evaluation of people ' s consciousness for river improvement works by means of CVM and Conjoint Analysis in view of flood protection, water utilization and environmental conservation                                                                   |
| Integrated river basin planning(4)                          | 1                     | River environmental improvement plan, Normal discharge, River restoration projects, Environmental assessment, etc.                                                                                                                                       |
| Integrated river basin planning(5)                          | 1                     | Classification of river structures and their functions, Impact assessment for construction of dam reservoirs and estuary barrages, etc.                                                                                                                  |
| Integrated river basin planning(6)                          | 1                     | Comprehensive management of sediment outflow and sediment budgets in river basins, concepts of recent sediment control dams, asset management of dam reservoirs, management of sediment dynamism for integrated river planning, etc.                     |

【Textbook】 Printed materials on the contents will be distributed in each lecture.

【Textbook(supplemental)】

【Prerequisite(s)】 Elementary knowledge of Hydraulics, Hydrology and Ecology

## Water Resources Engineering

水資源工学

【Code】 30320 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 【Lecture Form(s)】 Lecture 【Language】 【Instructor】 T.Kojiri, T.Hori and Y.Tachikawa

【Course Description】 Methodology for water resources development, management and conservation is introduced from the engineering viewpoint. Main topics are distribution of water resource on the earth, grasp and prediction of water demand, planning and design of water resources systems, estimation and prediction of river flow, policy and water rights, and operation of reservoirs.

【Grading】 Grading is done based on the mark on regular examination. Minimum passing grade is sixty percent.

【Course Goals】 The goal is to understand the basic theory and methodology for water demand prediction, water resources systems design, river flow estimation, water resources policy and reservoir operation.

### 【Course Topics】

| Theme                                         | Class number of times | Description                                                                                                           |
|-----------------------------------------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| Introduction, distribution of water resources | 1                     | Purpose and target of water resources engineering. spatial and temporal distribution of water resources.              |
| Water resources systems planning              | 2                     | water demand prediction, development and allocation of water resources.                                               |
| Integrated river basin management             | 2                     | Way of integrated management, multi-criteria and simulation for basin management, culture related to water resources. |
| Estimation of river flow                      | 4                     | General methods for river flow estimation, uncertainties in river flow estimation, and impact of global warming.      |
| Operation of water resources systems          | 3                     | Planning and management, off-line and real time operation, optimization of reservoir control.                         |
| Social and legal system for water resources   | 2                     | Social and legal system related to water resources. Water rights. Public and private water. Management and defect.    |
| Drought management                            | 1                     | Characteristics of droughts, countermeasures and drought management.                                                  |

【Textbook】

【Textbook(supplemental)】

【Prerequisite(s)】 It is desirable that students have already learned fundamental hydrology and systems analysis for planning and management.

## Mechanical Properties of Solids and Fracture Mechanics

固体の力学物性と破壊

【Code】 31900 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】

【Instructor】 Assoc. Prof. Tsukada and Assoc. Prof. Murata

【Course Description】 For crystalline materials such as rock and metal, macroscopic deformation behavior and destruction behavior is explained from the microscopic standpoint of fracture mechanics and solid mechanics.

【Grading】 A quiz or a report problem is given in every class. The grade is evaluated by the sum of scores of the quiz or the report and the final exam. The grading weights of them are 30% and 70% respectively.

【Course Goals】 The goals of this course are to master the evaluation of elastic modulus of crystalline materials considering its anisotropy and to master the fracture mechanics for a crack containing material by estimating stress intensity factor, energy release rate and J integral. By taking this course, students can understand the elastic deformation and strength of the crystalline materials and the crack containing material.

### 【Course Topics】

| Theme                                    | Class number of times | Description                                                                                                                                                                                                                     |
|------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction                             | 1                     | Overview of this course is presented, and then material testing method is simply explained.                                                                                                                                     |
| Structure of crystalline material        | 3                     | Basic form of space lattice of crystalline materials are lectured, and then the indication method of each crystalline form is presented.                                                                                        |
| Elastic modulus and theoretical strength | 3                     | Elastic modulus of single crystal and crystalline material is lectured from the point of atomic bond form, and then theoretical strength of a material is explained from atom level.                                            |
| Fracture mechanics                       | 5                     | Linear fracture mechanics and nonlinear fracture mechanics for a crack containing material are lectured. Stress intensity factor, energy release rate, J integral etc. are explained. Fracture in mixed mode is also explained. |
| Mechanical model of composite            | 1                     | Mechanical models of composite such as Vogit model, Reuss model, Eshelby's equivalent inclusion method, and Mori-Tanaka ' s mean field theory are lectured.                                                                     |
| Rheology                                 | 1                     | Macroscopic rheology models are reviewed, and then microscopic rheology based on the Eyring's rate process theory is explained.                                                                                                 |

【Textbook】 Not specified

【Textbook(supplemental)】 Naohiro Igata, Strength of materials, Baifukan Co., ISBN:4-563-03186-0

【Prerequisite(s)】 Differential calculus, integral calculus and linear algebra are necessary for this course.

【Web Sites】 This course does not have a web site.

【Additional Information】 Additional information is presented in the first class of each teacher.

## Geoinformatics

空間情報学

【Code】 31480 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 Techniques to collect, manage and analyze the spatial data and information related to the terrain and environment are introduced. Especially, Geographic Information System (GIS), satellite remote sensing and digital photogrammetry are focused on.

【Grading】 Evaluate considering the scores of intermediate examination (remote sensing and photogrammetry) and final examination (GIS), and the submitted reports.

【Course Goals】 The student will understand the techniques to obtain the spatial data, e.g. remote sensing and photogrammetry, and the system to effectively show and analyze such data, e.g. GIS. In addition, the student will understand the relationship between the techniques and the system.

### 【Course Topics】

| Theme                  | Class number of times | Description                                                                                                                                                                            |
|------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction           | 1                     | The purpose and role of geoinformatics, and the techniques related to geoinformatics are introduced.                                                                                   |
| Image processing       | 2                     | The student will understand (1) image format, (2) spatial filtering, (3) feature extraction, and (4) geometric transformation.                                                         |
| Digital photogrammetry | 2                     | The student will understand (1) interior orientation, (2) exterior orientation, (3) collinearity condition, and (4) coplanarity condition, and (5) epipolar line.                      |
| Remote sensing         | 2                     | The student will understand (1) visible and reflective infrared remote sensing, (2) thermal remote sensing, (3) microwave remote sensing, and (4) LiDAR (Light Detection and Ranging). |
|                        | 6                     |                                                                                                                                                                                        |

【Textbook】 Handout will be provided if necessary.

【Textbook(supplemental)】 Japan Association on Remote Sensing, "Remote Sensing Note", Kohei Cho, "Spatial Data Analysis using GIS"

【Prerequisite(s)】 It is expected that the student has completed the courses,

- (1) Statistics (first semester in the second year), and
- (2) Surveying and practice (first semester in the third year).

## Concrete Engineering

コンクリート工学

【Code】 30250 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 The basic theory and the design technique of reinforced concrete (RC) and prestressed concrete (PC) structure are explained with the mechanical behavior of the materials introduced in ‘ Construction Materials ’ .

Be sure and attend the lecture with your text book. Some homework are assigned to enlarge your knowledge.

【Grading】 Grading is based on the result of a term-end examination with the homework and attendance.

【Course Goals】 Students of this class learn to understand the basic theory and the design technique of reinforced concrete (RC) and prestressed concrete (PC) structure, and calculate the resistance and the response of simple RC/PC member.

【Course Topics】

| Theme                                        | Class number of times | Description                                                                                                                    |
|----------------------------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Introduction                                 | 1                     | Concrete structure and its characteristic are introduced.                                                                      |
| Fundamental of design                        | 2                     | The design method, the safety factor and etc. are explained.                                                                   |
| Structural materials                         | 1                     | The mechanical behavior of concrete, reinforcing steel and polymer material is explained.                                      |
| Bond behavior and anchorage                  | 2                     | The mechanism of bond and anchorage is explained.                                                                              |
| Flexural and compression behavior            | 2                     | The mechanical behavior and the capacity of RC section subjected to the flexural moment and/or the normal force are explained. |
| Shear and torsion behavior                   | 2                     | The mechanical behavior and the capacity of RC section subjected to the shear force and/or the torsional moment are explained. |
| Crack and deflection                         | 2                     | The cracks and deflection of RC member are explained.                                                                          |
| Verification method of performance over time | 1                     | The verification method of performance over time including the corrosion of the reinforcing steel is explained.                |
| Others                                       | 1                     | The latest research and technique relating to concrete engineering are introduced.                                             |
| A term-end examination                       | 1                     | A term-end examination is done during a regular examination period.                                                            |

【Textbook】 K. Kobayashi: Concrete Engineering, Morikita Publishing Co., Ltd., 3,150JPY

【Textbook(supplemental)】

【Prerequisite(s)】 Students of this class had better take ‘ Structural Mechanics I and Exercises (30080) ’ in 2nd year and ‘ Construction Materials (30240) ’ in 3rd year.

# Earthquake and Wind Resistance of Structures, and Related Structural

## Design Principles

耐震・耐風・設計論

【Code】 31500 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 To understand fundamentals of design theory for civil infrastructures. To explain various design loads, including dead load, live load, temperature load, seismic load, and wind load, limit states of structures and their evaluation, demand performance. To design structures considering reliability, optimal design, serviceability, aesthetics, and environment.

【Grading】 Based on the performance during the course (including homework) and the results of a final examination.

【Course Goals】 To understand fundamentals of design for civil infrastructures.

To understand fundamentals of load, limit state of structures, reliability design and optimal design.

To understand fundamentals of characteristics of natural wind, aerodynamics of structures, design wind and wind resistant design.

To understand fundamentals of earthquake mechanism and seismic response of structures, seismic load, and seismic design.

### 【Course Topics】

| Theme                                                                       | Class number of times | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction of design theory of civil infrastructure                       | 2                     | Design theory of civil infrastructures is introduced. The concept and significance of design, objective of design, characteristics of civil infrastructures, flow of design process, mechanical design, multi-level decision making are discussed. Engineering ethics are also explained.                                                                                                          |
| Introduction of load                                                        | 3                     | Design loads for civil infrastructures are introduced. The characteristics and classification of design loads are explained and their quantitative expression is discussed. Especially statistic characteristics of random loads, i.e. seismic load and wind load, are explained.                                                                                                                  |
| Prediction of earthquake ground motion and earthquake response of structure | 2                     | Methods for predicting earthquake ground motion are introduced based on the theories of earthquake mechanism and ground vibration. Equation of motion for the single degree of freedom system and its solution are also explained in order to estimate earthquake response of structure. Design methods for infrastructures are interpreted on the basis of theories of elasticity and plasticity. |
| Characteristics of natural wind and aerodynamics of structures              | 2                     | The characteristics of natural wind and strong wind are explained and process of design wind for structures is discussed. And various aerodynamics (vortex-induced vibration, galloping, flutter, buffeting, and etc.) acting on structural section with various geometric shape and their generation mechanism are explained.                                                                     |
| Limit state of structure and reliability analysis                           | 3                     | The outline of structural safety analysis is introduced for serviceability, ultimate and fatigue limit of structures. As for uncertainties in various actions to structures and the resistance of structures, the design methods such as allowable stress method, limit states method with partial safety factors will be discussed in conjunction with reliability analysis.                      |
| Seismic design, wind resistant design, optimal design, and landscape design | 3                     | Seismic design, wind resistant design, optimal design and landscape design for various structures, including long span bridge                                                                                                                                                                                                                                                                      |

【Textbook】 Hand-outs are distributed when necessary.

【Textbook(supplemental)】

【Prerequisite(s)】 Probabilistic and Statistical Analysis and Exercises(30030), Dynamics of Soil and Structures(31110), Structural Mechanics I and Exercises(30080), Structural Mechanics II and Exercises(31640), and Fluid Mechanics(31650)

## Computer Programming and Experiment on Structural Mechanics

構造実験・解析演習

【Code】 31490 【Course Year】 3rd year 【Term】 2nd term 【Class day & Period】 【Location】 【Credits】 2  
 【Restriction】 No Restriction 【Lecture Form(s)】 【Language】 【Instructor】

【Course Description】 Practical understanding and application of the theory that have been learned in “ Structure mechanics and Exercises ” and “ Structure mechanics and Exercises ” .

To learn the measurement technique on strain, deflection and vibration in experiment, and the fundamentals/application on computer programming for matrix methods for structural analysis in computational exercise which are needed for understanding of the mechanical properties of member and/or structure.

【Grading】 Grade is given based on attendance and reports.

【Course Goals】 To understand the fundamentals of measurement of strain, deflection and vibration

To deeply understand theory of structure mechanics by beam experiment

To understand numerical analysis approach of structures by use of matrix methods

To deeply and synthetically understand mechanical behaviors and validation methods of structures by comparing the experimental results with those resulted from matrix methods

## Global Engineering for Disaster Reduction

地球防災工学

【Code】 30880 【Course Year】 4th year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 Lecture 【Language】 【Instructor】

【Course Description】 Civil Engineering manages basic built environments in our society, which maintains quality of civic life, and save life and properties. This lecture discusses the role of civil engineering as the basic elements based on Business Continuity Management and Critical Infrastructure Protection concept.

【Grading】 Mini reports after each lectures, and the end of semester reports examination

【Course Goals】 Acquiring basic the understanding about CIP ( Critical Infrastructure Protection ) and BCP (Business Continuity Planning)

【Course Topics】

| Theme                                           | Class number of times | Description                                                                                                                                                                     |
|-------------------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Definition of Critical Infrastructure           | 3                     | Definition and history of Critical Infrastructure will be discussed.                                                                                                            |

## Construction Materials, Laboratory

材料実験

【Code】 30860 【Course Year】 4th year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 【Language】 【Instructor】

【Course Description】 Experiments on the materials for concrete and concrete member are carried out in the main. Properties of concrete materials and member are discussed by using those experimental results.

Be sure and attend the laboratory with your experimental text book. The schedule and details of the experiment are announced at the initial lecture. Students of this laboratory class have to attend an initial lecture because they are to be divided into some groups.

【Grading】 A report with the experimental results and discussion is assigned in each time. The grading is based on the total point of reports and attendance.

【Course Goals】 Students of this class practically learn to understand the properties of concrete material and member introduced in 'Construction Materials' and 'Concrete Engineering', and its measurement technique.

【Course Topics】

| Theme                                                                 | Class number of times | Description                                                                                                                                                                                                                                   |

| Introduction                                                          | 1                     | The objective and contents of this laboratory are introduced. The fundamentals of the measuring and testing method are also introduced.                                                                                                       |
| Cement                                                                | 1                     | The density, the fineness and the setting time of cement, and the flow of mortar are tested.                                                                                                                                                  |
| Aggregate                                                             | 1                     | The density, the water absorption ratio, the grading, unit mass and surface water ratio of fine and coarse aggregate are tested.                                                                                                              |
| Mix proportion design of concrete and fresh concrete                  | 1                     | Mix proportion of concrete is designed using the results of ' cement ' and ' aggregate ' . The condition of fresh concrete made by using the designed mix proportion is examined. The test specimens for ' hardened concrete ' are also cast. |
| Hardened concrete                                                     | 2                     | Some destructive and non-destructive tests are performed in the test specimens cast in ' fresh concrete ' .                                                                                                                                   |
| Reinforcing steel bar                                                 | 1                     | The yield strength, the tensile strength and the elongation are obtained in the reinforcing steel bar for concrete.                                                                                                                           |
| Design of reinforced concrete (RC) and prestressed concrete (PC) beam | 3                     | The reinforced concrete (RC) and prestressed concrete (PC) beam are designed.                                                                                                                                                                 |
| Casting of RC and PC beam                                             | 1                     | The designed RC and PC beam specimens are cast.                                                                                                                                                                                               |
| Prestressing                                                          | 1                     | The prestress is introduced in PC beam by post tensioning system.                                                                                                                                                                             |
| Loading test of RC and PC beam                                        | 2                     | Loading test for RC and PC beam specimens is carried out. The flexural behavior of RC and PC beam is investigated, comparing the experimental loading capacity with the designed one.                                                         |
| Topics                                                                | 1                     | The latest research and/or technique of concrete are introduced.                                                                                                                                                                              |
| A term-end examination                                                | 0                     | A term-end examination is not done.                                                                                                                                                                                                           |

【Textbook】 The Society of Materials Science, Japan: Construction Materials Laboratory, 1,600JPY

【Textbook(supplemental)】

【Prerequisite(s)】 Members of this class had better take ' Construction Materials (30240) ' and ' Concrete Engineering (30250) ' in 3rd year.

## Design Exercise for Global Engineering A

地球工学デザイン A

【Code】 31770 【Course Year】 4th year 【Term】 1st term 【Class day & Period】 【Location】 【Credits】 2

【Restriction】 No Restriction 【Lecture Form(s)】 【Language】

【Instructor】 M. Kawasaki, Y. Kubota, (Pacific Consultants) Y. Ito, (ditto) K. Nishiyama, (ditto) R. Nishigami

【Course Description】 "Design" is an act of synthesis, so it is an opposite act of analysis in general (however in the process, multiple analyses are contained). Synthesis is not mere summation of elements. In this class, we approach to the synthesis of design from "understanding of basic knowledge", "skill of thinking, informing and expression", "acquiring of process knowledge" and "case studies". Then, with the general concept of design, we learn concrete discipline of "civil engineering design" which should be treated with a creation of aesthetic environment in our public spaces.

【Grading】 Total points will be scored in attendance (40%) and results of design practice and reports (60%). Teamwork is important in the competition, so the members in the same team will be given the same points.

【Course Goals】 To understand the basic knowledge and skills of civil engineering design. To acquire the process knowledge by team design. At last, students are expected to get design-mindsets as civil engineers.

【Course Topics】

| Theme                                  | Class number of times | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Guidance                               | 1                     | Guidance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Space unit and functional space        | 2                     | Understanding of "unit space" and "functional space" is firstly important when we design spaces. In this class, the concept and cases are shown. Then the rule and affordance of space which exist in the relationship between man and environment. As an application of affordance, we learn universal design and think what is the "function" of spaces. Moreover, the general concept of "design" which is important for both engineers and designers, we discuss what is civil engineering design with the reflection of general concept of design.                                     |
| Practice of tracing drawings           | 2                     | Learning graphics of drafting lines and landscape elements, which are important to conceive, display and express designs. Practice of tracing exemplary case drawings to understand the rolls of drawings and acquire the sense of scale and the basic skill of drawing expression.                                                                                                                                                                                                                                                                                                         |
| Civil engineering design competition   | 4                     | "Team design" is a characteristic of civil engineering design. In big civil engineering projects, a person can hardly design everything. So the team design is needed. Moreover, in real process of decision making of design, the best proposal is chosen among multiple alternatives. In this class, students will be separated into some teams to challenge the design competition. Each team will execute the collection of information, observation, analysis, making concept, conceive ideas, integration of ideas, evaluation and presentation. The best team will be given a prize. |
| Front line of civil engineering design | 5                     | Through the lectures and design practices by professionals who are working on the front line of civil engineering design, we learn how engineering and design are combined, how they are integrated into public spaces and how they are managed in the process. As themes, for example, "creativity of structural design", "design of green and environment" and "city planning and landscape" are planned to deepen our understanding.                                                                                                                                                     |

【Textbook】

【Textbook(supplemental)】

【Prerequisite(s)】 It is desirable to have taken the class of "Urban and Landscape Design"

【Web Sites】

【Additional Information】 Office hours are not especially set. Ask any questions by mailing or visiting professors (Kawasaki, rm.202; Kubota, rm.201, C1-1 at Katsura Campus). The theme of design practice could be changed partially.

【Course Description】 This course will outline the overview of the existing laws on administration of public works and explain their implication to nation building, community development, and civil engineering facilities as well as practice in planning, construction, management, and operation.

【Grading】 The final grade will be determined based on a comprehensive assessment of the final examination, papers, and other assignments.

【Course Goals】 The objective of this course is to gain an understanding of the existing laws on administration of public works, their implications to nation building, community development, and civil engineering facilities, and practice in planning, construction, management, and operation.
